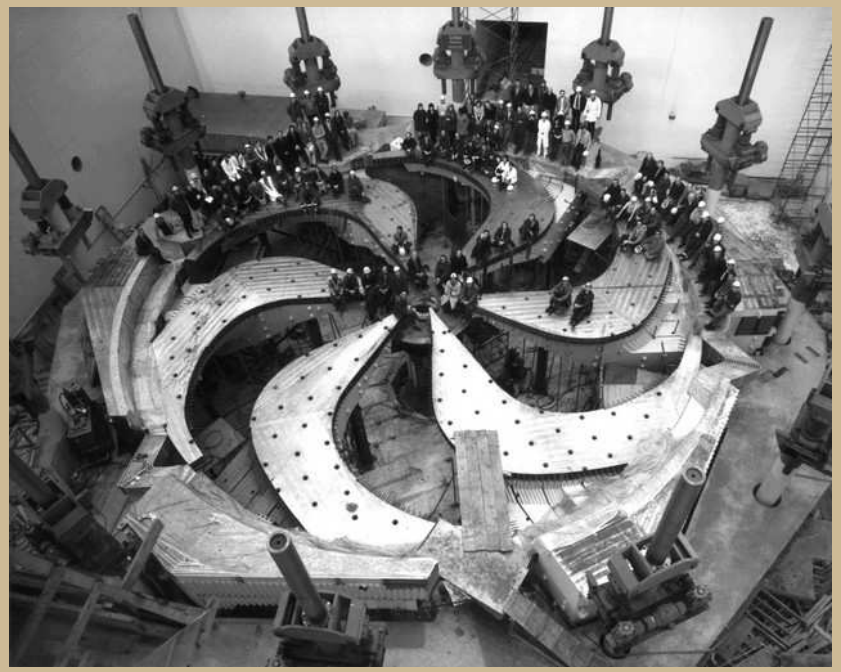
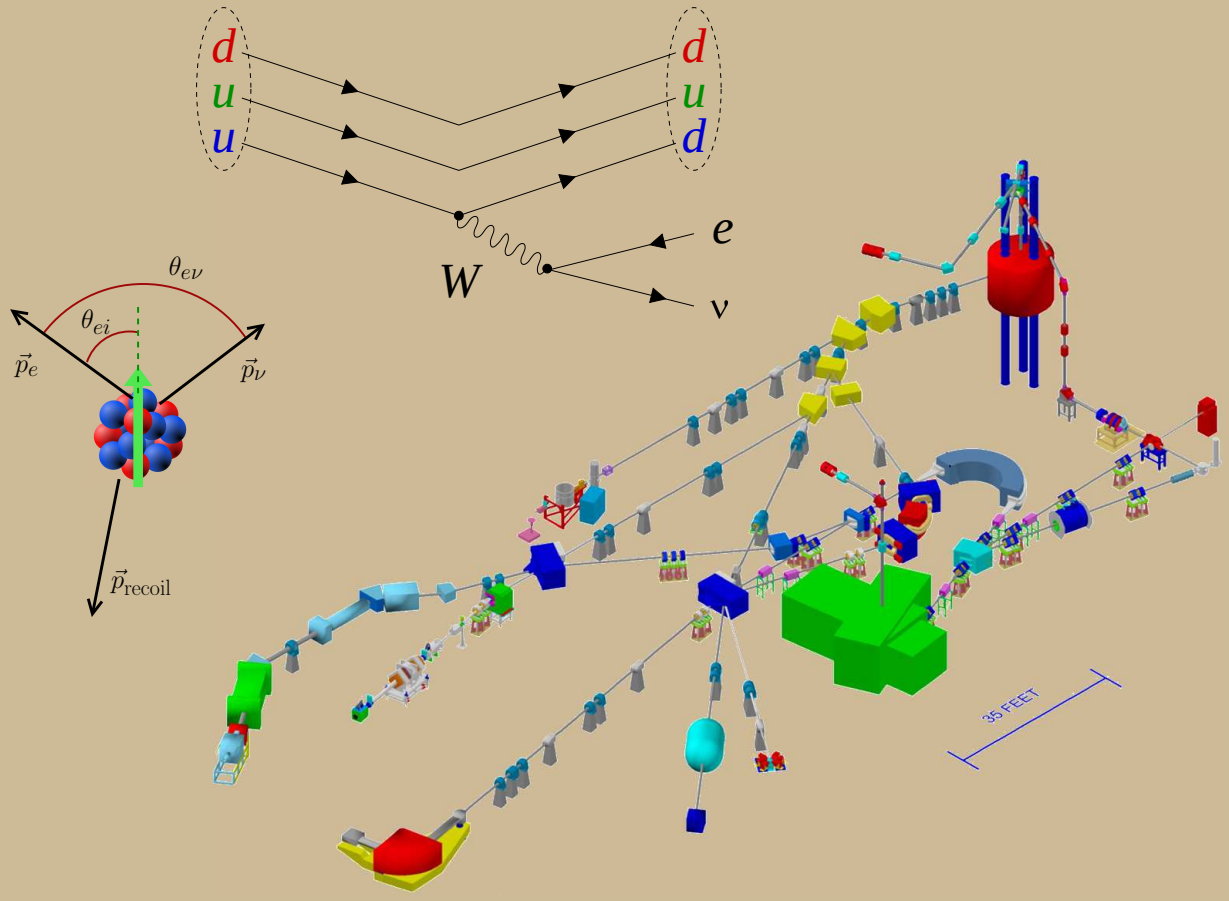
Precision β-decay Studies using Trapped Atoms and Ions





Dan Melconian

November 20, 2013

Overview

1. Fundamental symmetries

- what is our **current understanding**?
- how do we test what lies **beyond**?

2. TAMU Penning Trap

- **physics** of superallowed β decay
- **ion trapping** of proton-rich nuclei at T-REX

3. TRIUMF Neutral Atom Trap

- angular correlations of **polarized ^{37}K**
- **preliminary results** of a recent run

Scope of fundamental physics

					$W^\pm$ Z°	weak
quarks	$\begin{pmatrix}u\\ d\end{pmatrix}$	$\begin{pmatrix}c\\ s\end{pmatrix}$	$\begin{pmatrix}t\\ b\end{pmatrix}$	$+2/3$ $-1/3$	γ	EM

The Standard Model

All of the ***known*** elementary particles and their interactions are described within the framework of

The *new* **Standard Model**

- **quantum** + **special rel** $\Rightarrow$ **quantum field theory**
- Noether's theorem: symmetry $\Leftrightarrow$ conservation law
- $SU(3) \times SU(2)_L \times U(1)$: strong + electroweak
- **12 elementary particles**, **4 fundamental forces** and (at least) **1 Higgs boson**

	1st	2nd	3rd	Q	mediator	force
leptons	$\begin{pmatrix}\nu_e\\ e\end{pmatrix}$	$\begin{pmatrix}\nu_\mu\\ \mu\end{pmatrix}$	$\begin{pmatrix}\nu_\tau\\ \tau\end{pmatrix}$	0 -1	g	strong
					$W^\pm$ Z°	weak
quarks	$\begin{pmatrix}u\\ d\end{pmatrix}$	$\begin{pmatrix}c\\ s\end{pmatrix}$	$\begin{pmatrix}t\\ b\end{pmatrix}$	$+2/3$ $-1/3$	γ	EM

That's all fine and dandy, but. . .

does the Standard Model work??

That's all fine and dandy, but. . .

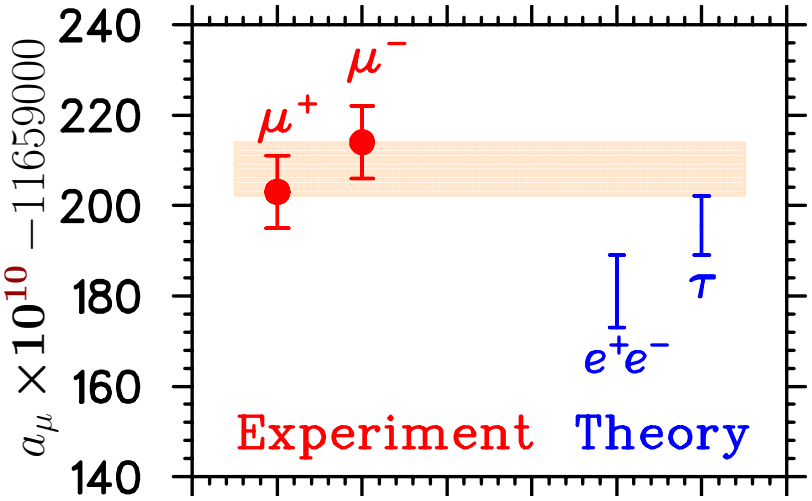
does the Standard Model work??

- ✔ it **predicted** the existence of the $W^{\pm}$, $Z_{\circ}$, g, c and t
  $\rightsquigarrow$ and now **the Higgs!**
- ✔ is a **renormalizable** theory
- ✔ GSW $\Rightarrow$ **unified** the **weak** force with **electromagnetism**
- ✔ QCD **explains** quark confinement

That's all fine and dandy, but. . .

does the Standard Model work??

- ✔ it **predicted** the existence of the $W^{\pm}$, Z_o, g, c and t
  $\rightsquigarrow$ and now **the Higgs!**
- ✔ is a **renormalizable** theory
- ✔ GSW $\Rightarrow$ **unified** the **weak** force with **electromagnetism**
- ✔ QCD **explains** quark confinement



$$a_\mu \equiv \tfrac{1}{2}(g-2)$$

± 1 **part-per-*million*!!**

(PRL **92** (2004) 161802)

That's all fine and dandy, but. . .

does the Standard Model work??

$$a_\mu \equiv \tfrac{1}{2}(g-2)$$

± 1 **part-per-*million*!!**

(PRL **92** (2004) 161802)

Wow . . . this is

the most precisely tested theory ever conceived!

But there are still questions . . .

parameters values: does our "ultimate" theory *really* need **25** arbitrary constants? Do they **change** with time?

dark matter: SM physics makes up **only 4%** of the energy-matter of the universe!

baryon asymmetry: why more **matter** than **anti-matter**?

strong *CP*: do **axions** exist? **Fine-tuning**?

neutrinos: **Dirac** or **Majorana**? Mass **hierarchy**?

fermion generations: why **three** families?

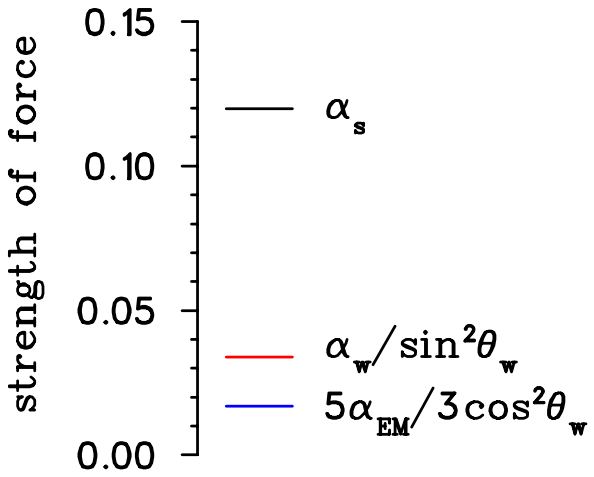
weak mixing: Is the CKM matrix **unitary**?

parity violation: is parity **maximally** violated in the weak interaction? No **right-handed** currents?

gravity: of course can't forget about a **quantum** description of **gravity**!

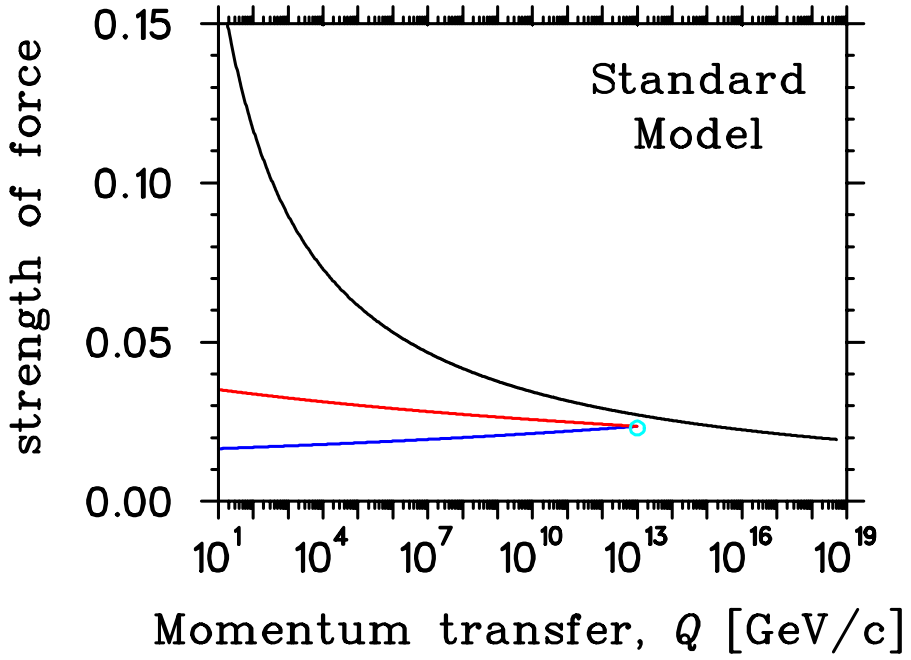
Beyond the Standard Model

At our energy scales, we see four distinct forces . . .



Beyond the Standard Model

But these coupling 'constants' **aren't** really *constant*: $\alpha_i \rightarrow \alpha_i(Q)$

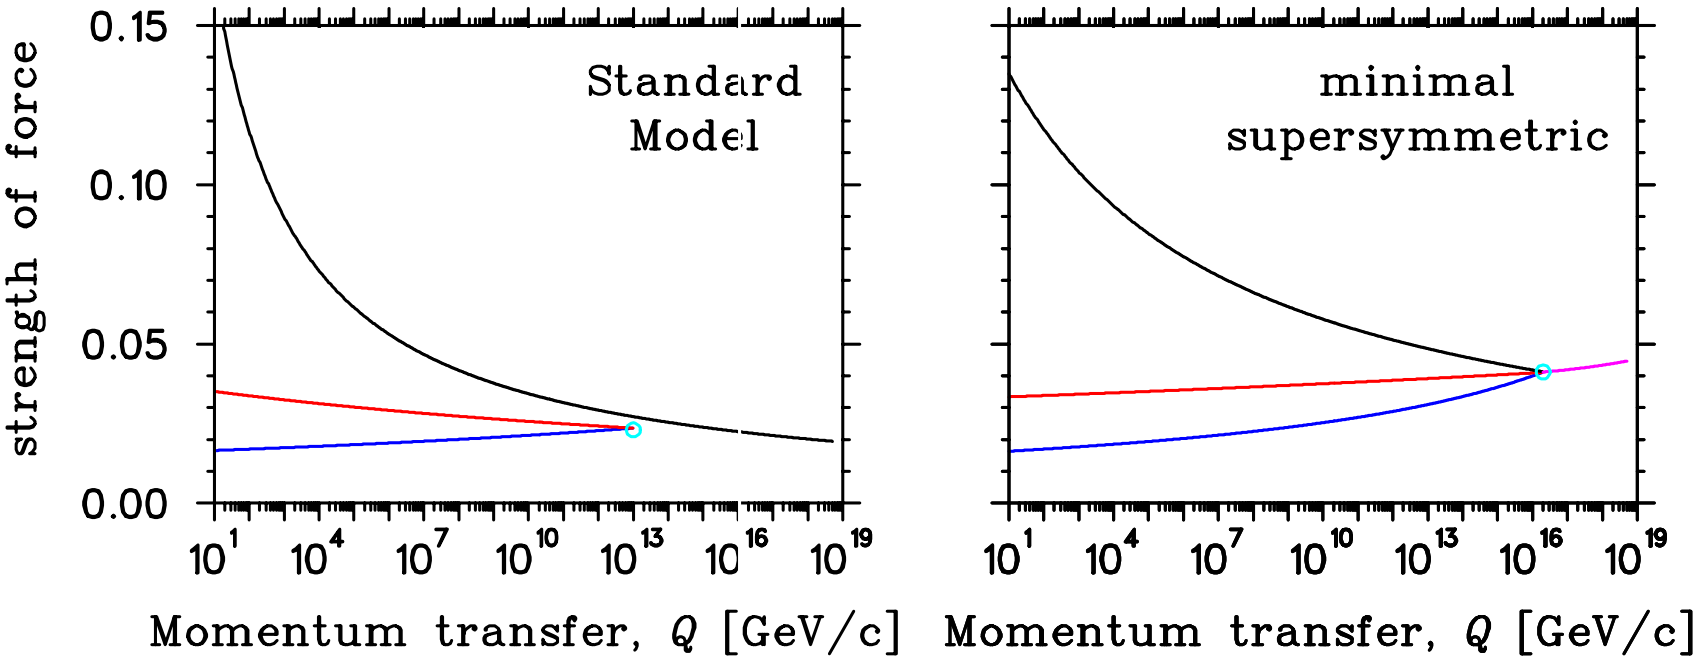


$\rightarrow$ electromagnetic and weak strengths equal at $\approx 10^{13}$ GeV

$\rightarrow$ strong force gets weaker, but doesn't unify with EW. . . .

Beyond the Standard Model

But what if there is **new physics** we haven't seen yet?



the running of the coupling constants would be affected; maybe they converge at some GUT scale?

Are the three theories of **E & M**, **weak** and **strong** interactions all **low-energy limits** of **one unifying** theory?

How do we test the SM?

- **colliders**: CERN, SLAC, FNAL, BNL, KEK, DESY . . .
- **nuclear physics**: traps, exotic beams, neutron, EDMs, $0\nu\beta\beta$, . . .
- **cosmology** & **astrophysics**: SN1987a, Big Bang nucleosynthesis, . . .
- **muon decay**: Michel parameters: ρ, δ, η, and ξ
- **atomic physics**: anapole moment, spectroscopy, . . .

How do we test the SM?

[4]*EP Division, CERN, Geneva, Switzerland CH-1211*

(Received 24 February 1999)

The positron-neutrino correlation in the $0^+ \rightarrow 0^+$ β decay of ^{32}Ar was measured at ISOLDE by analyzing the effect of lepton recoil on the shape of the narrow proton group following the superallowed decay. Our result is consistent with the standard model prediction. For vanishing Fierz interference we find $a = 0.9989 \pm 0.0052 \pm 0.0039$, which yields improved constraints on scalar weak interactions.

Doppler shape of delayed proton depends on $\vec{p}_e \cdot \vec{p}_\nu$!

- **strong** branch to g.s.
- **polarization/alignment**
- **mixed** Fermi/Gamow-Teller

$\Rightarrow$ need $\rho \equiv G_A M_{GT} / G_V M_F$ to get SM prediction for correlation parameters

get ρ from the comparative half-life:

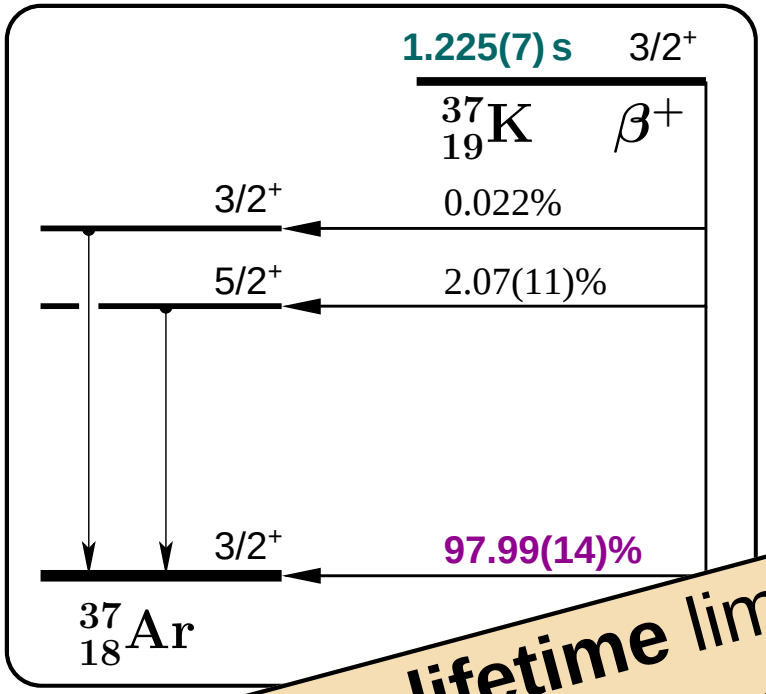
$$\rho^2 = \frac{2\mathcal{F}t^{0^+\rightarrow 0^+}}{\mathcal{F}t} - 1$$

Q_{EC}: $\pm 0.003\%$
BR: $\pm 0.14\%$
$t_{1/2}$: $\pm \mathbf{0.57\%}$

$\mathcal{F}t = 4562(28)$ $\Rightarrow$ $\rho = 0.5874(\mathbf{71})$

The β^+-decay of ^{37}K

Almost as simple as $0^+ \rightarrow 0^+$:



- **isobaric analogue** decay
- **strong** branch to g.s.
- **polarization/alignment**
- **mixed** Fermi/Gamow-Teller

$\Rightarrow$ nee... $a_{GT}/G_V M_F$ for correla-

The **lifetime** limits the $\mathcal{F}t$ value
- and hence precision of ρ
- and hence the SM predictions of the correlation parameters

get ρ

$$\frac{1}{\mathcal{F}t} = \frac{G_V^2}{K/(2\pi^3\hbar^7 c^3)} \left(1 + \Delta_R^V\right)\left(M_F^2 + \frac{G_A^2}{G_V^2} M_{GT}^2\right) - 1$$

Q_{EC}:

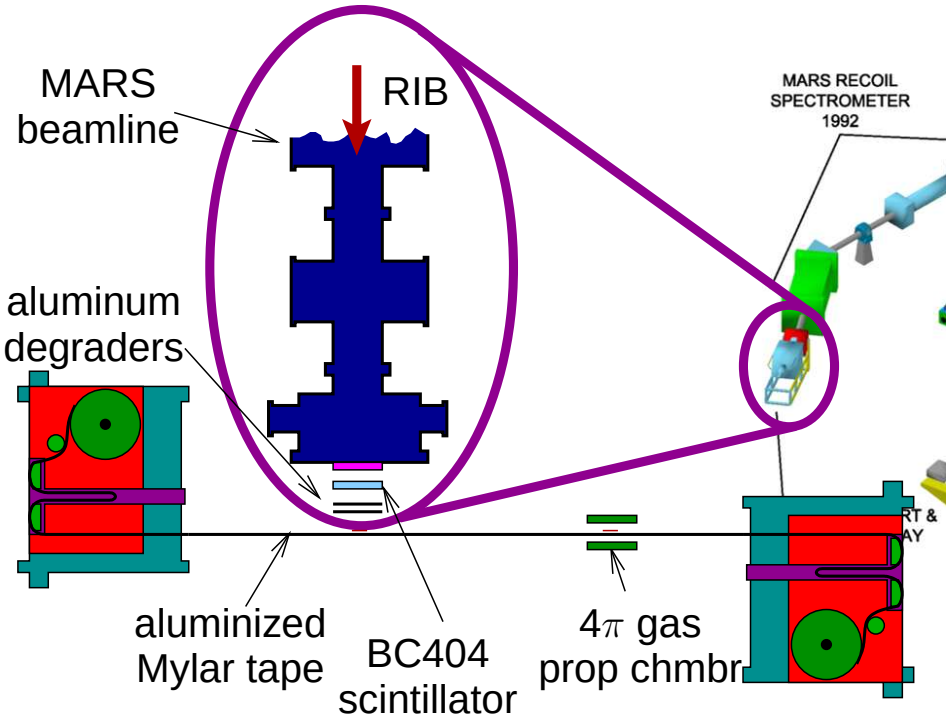
BR: ...%

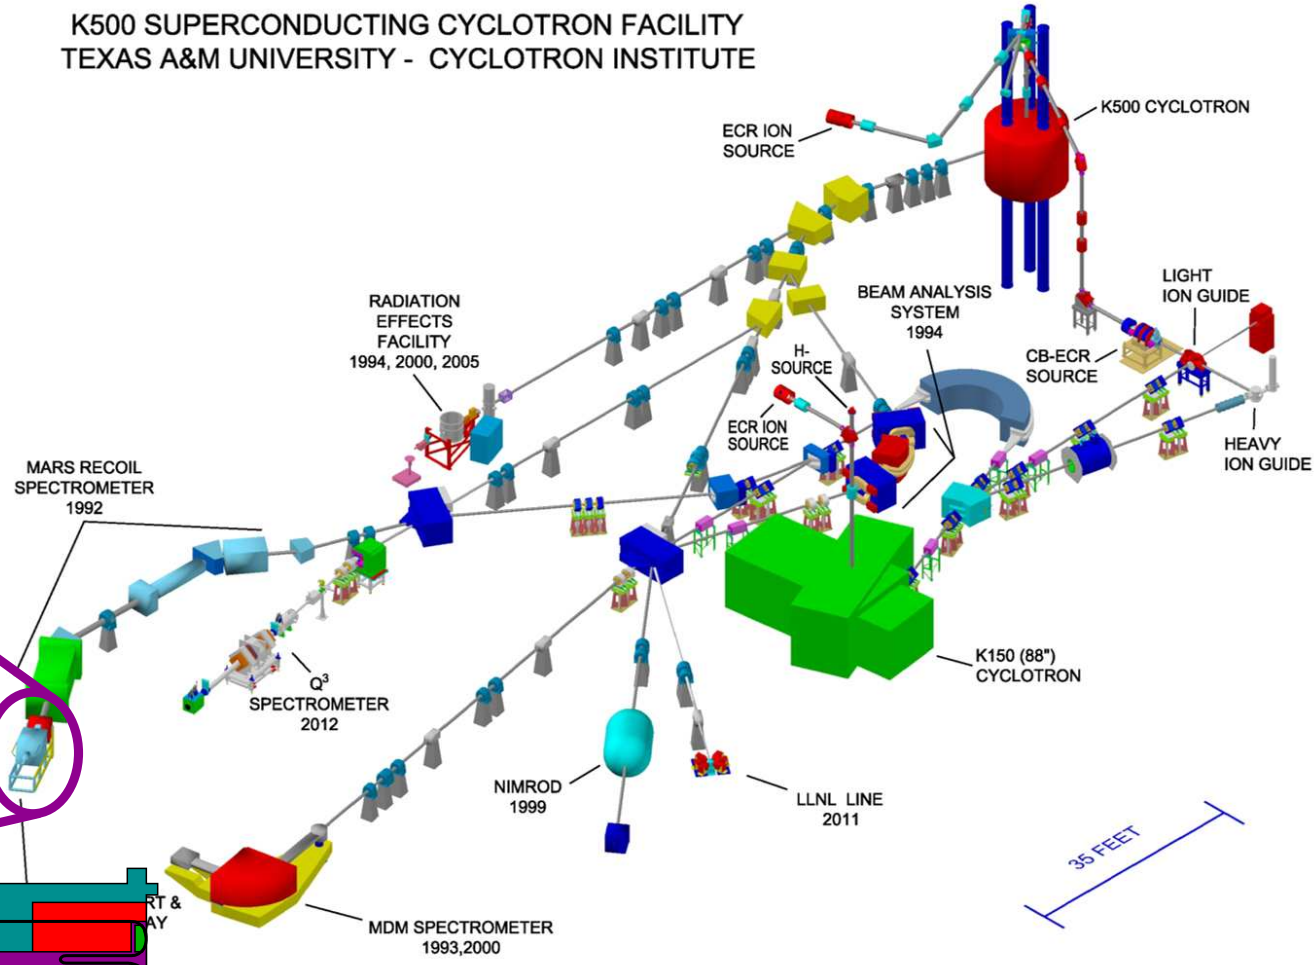
$t_{1/2}$: **±0.57%**

$$\mathcal{F}t = 4562(28) \Rightarrow \rho = 0.5874(\mathbf{71})$$

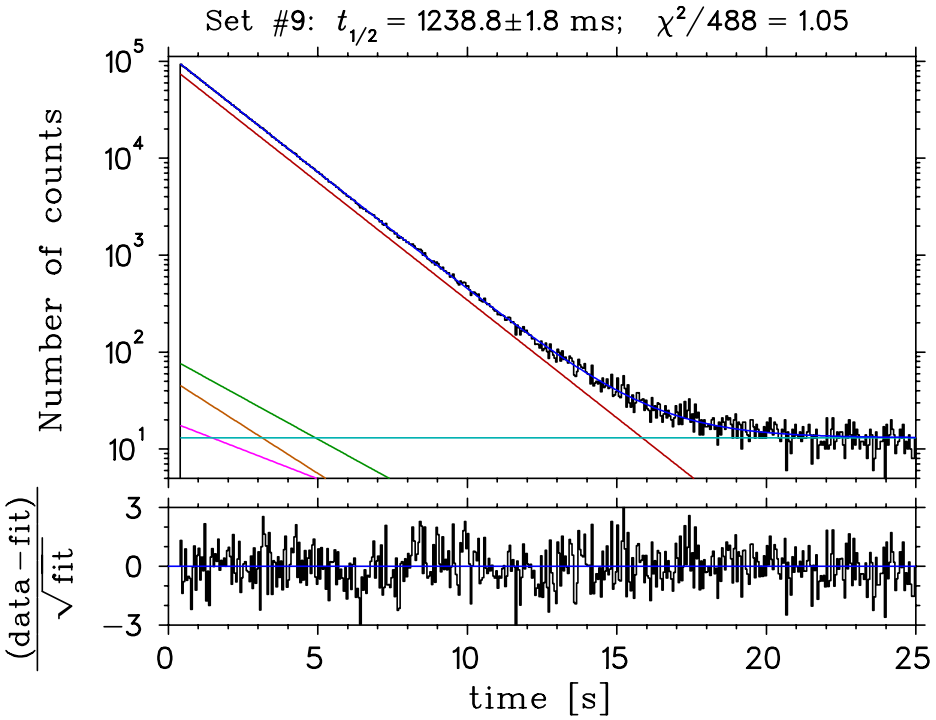
Measuring the lifetime at the CI

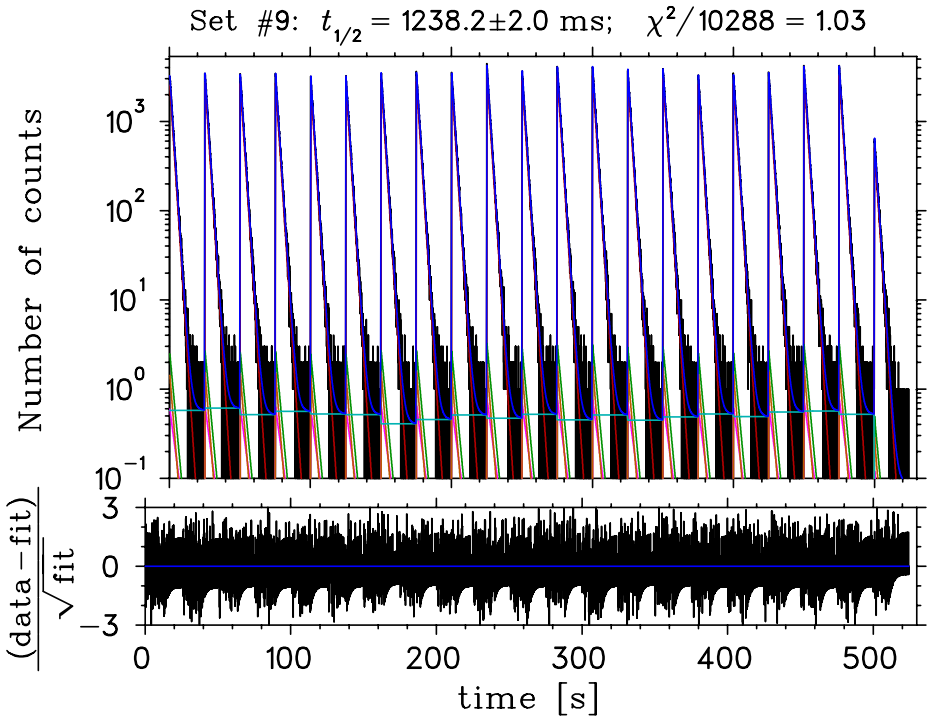
$^{38}\mathrm{Ar}\,(p, 2n)^{37}\mathrm{K}$



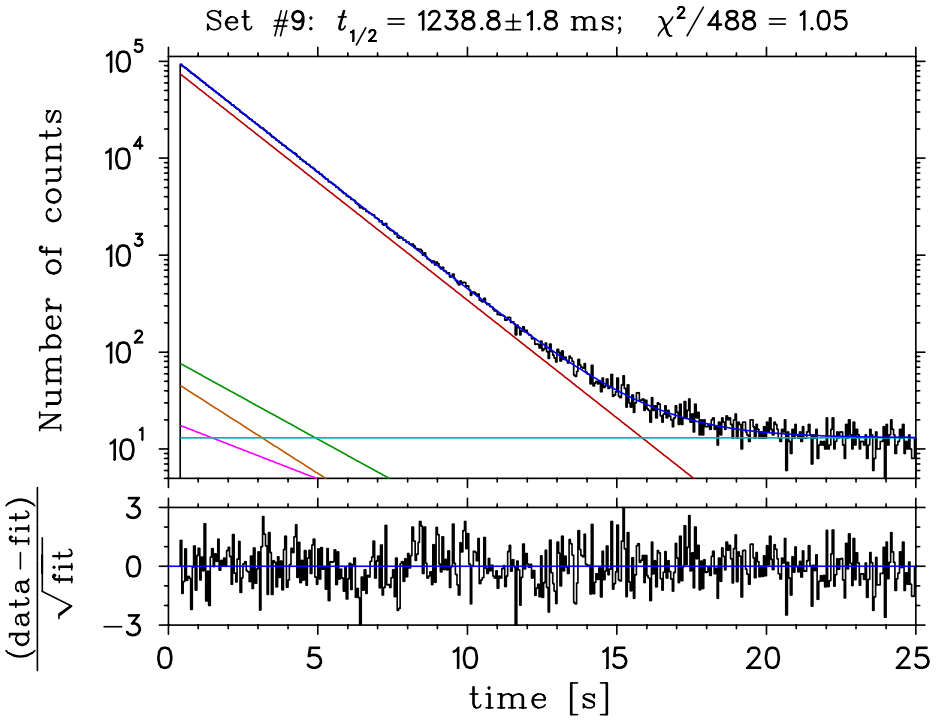


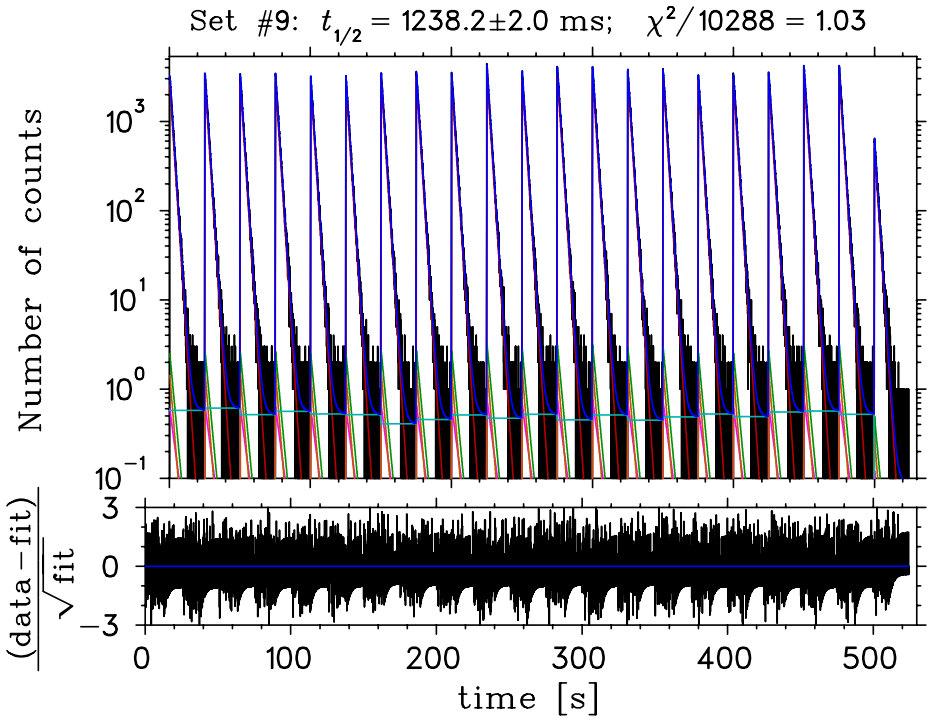
Improving the lifetime





Improving the lifetime





nearly a $10\times$ improvement: $t_{1/2} = 1236.51 \pm 0.47 \pm 0.83$ ms

$$\Rightarrow \quad \Delta\mathcal{F}t = 0.62\% \quad \longrightarrow \quad 0.18\%$$

and $\quad \Delta\rho = 1.2\% \quad \longrightarrow \quad 0.4\%$

$$dW \sim 1 + a_{\beta\nu}\frac{\vec{p}_e\cdot\vec{p}_\nu}{E_e E_\nu} + b\Gamma\frac{m}{E_e} + \frac{\vec{I}}{I}\cdot\left[\boldsymbol{A_\beta}\frac{\vec{p}_e}{E_e} + \boldsymbol{B_\nu}\frac{\vec{p}_\nu}{E_\nu} + \boldsymbol{D}\frac{\vec{p}_e\times\vec{p}_\nu}{E_e E_\nu}\right]$$

Correlation	SM prediction
$\beta-\nu$ correlation:	$a_{\beta\nu} = 0.6580(\mathbf{61}) \rightarrow 0.6668(\mathbf{18})$
Fierz interference parameter:	$b = 0$ (sensitive to scalars and tensors)
β asymmetry:	$A_\beta = -0.5739(\mathbf{21}) \rightarrow -0.5719(\mathbf{7})$
ν asymmetry:	$B_\nu = -0.7791(\mathbf{58}) \rightarrow -0.7703(\mathbf{18})$
Time-violating D coefficient:	$D = 0$ (sensitive to imaginary couplings)

Precision measurements of these correlations to $\lesssim \mathbf{0.1\%}$ complement collider experiments and test the SM

and Cirigliano, González-Alonso and Graesser, JHEP **1302** (2013)

Thank you, AMO physicists!!

Atomic methods have opened up a new vista in precision work and provide the ability to push β decay measurements to $\lesssim 0.1\%$

- laser-cooling and trapping (magneto-optical traps)
- sub-level state manipulation (optical pumping)
- characterization/diagnostics (photoionization)

Thank you, AMO physicists!!

Atomic methods have opened up a new vista in precision work and provide the ability to push β decay measurements to $\lesssim 0.1\%$

- laser-cooling and trapping (magneto-optical traps)

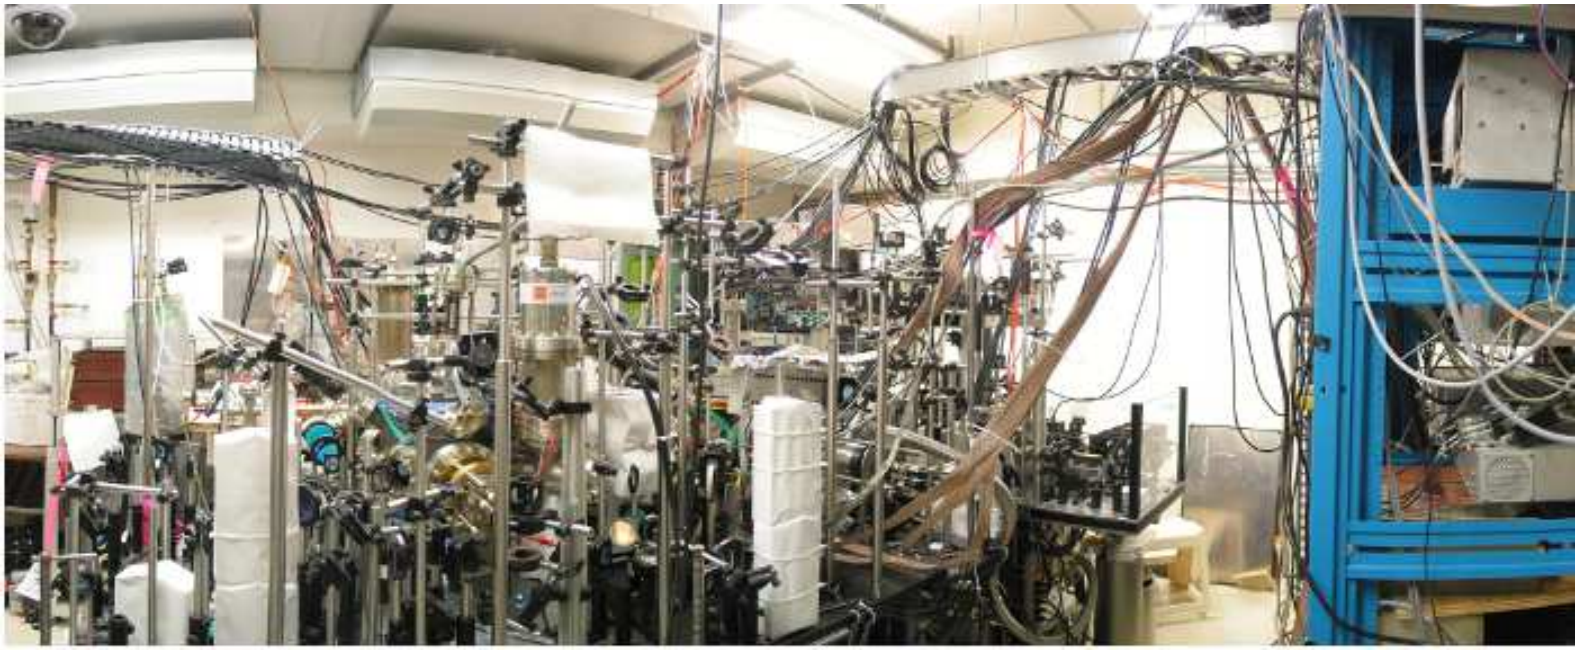
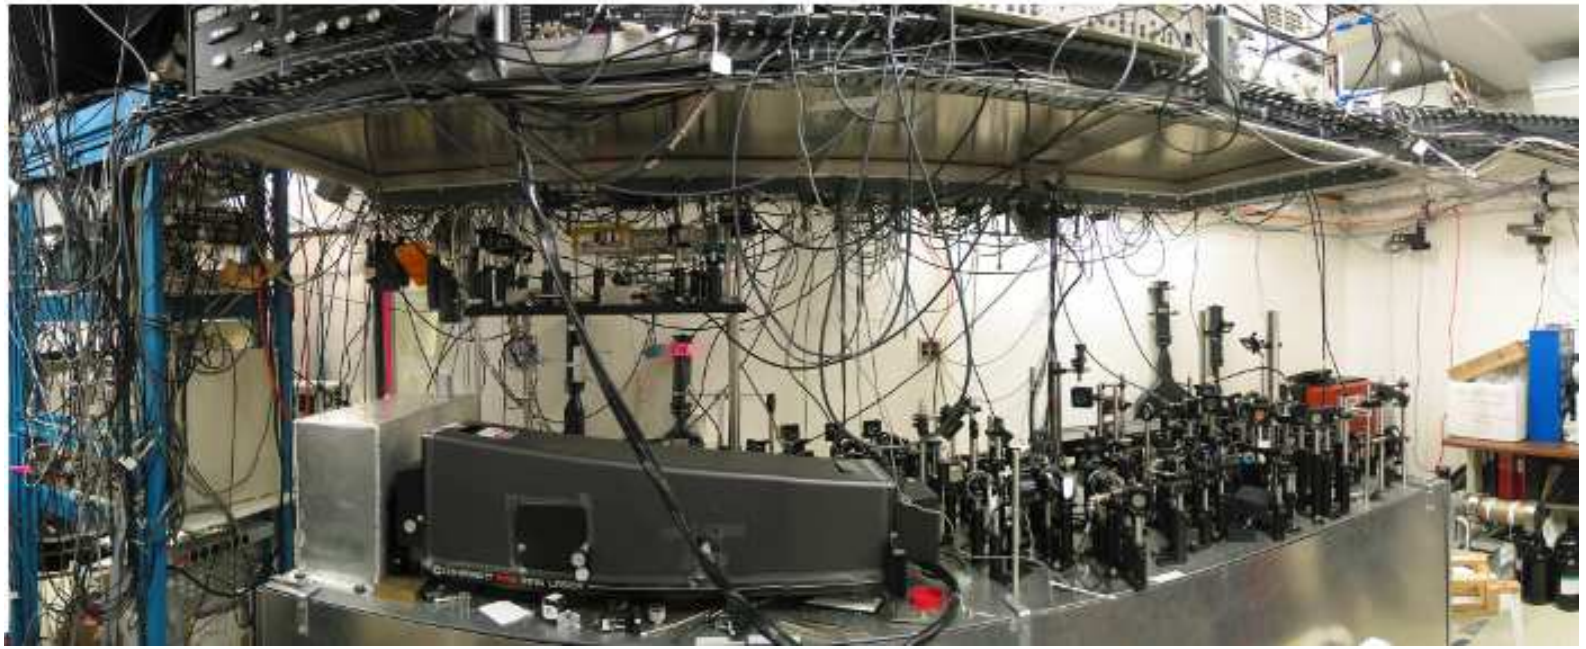
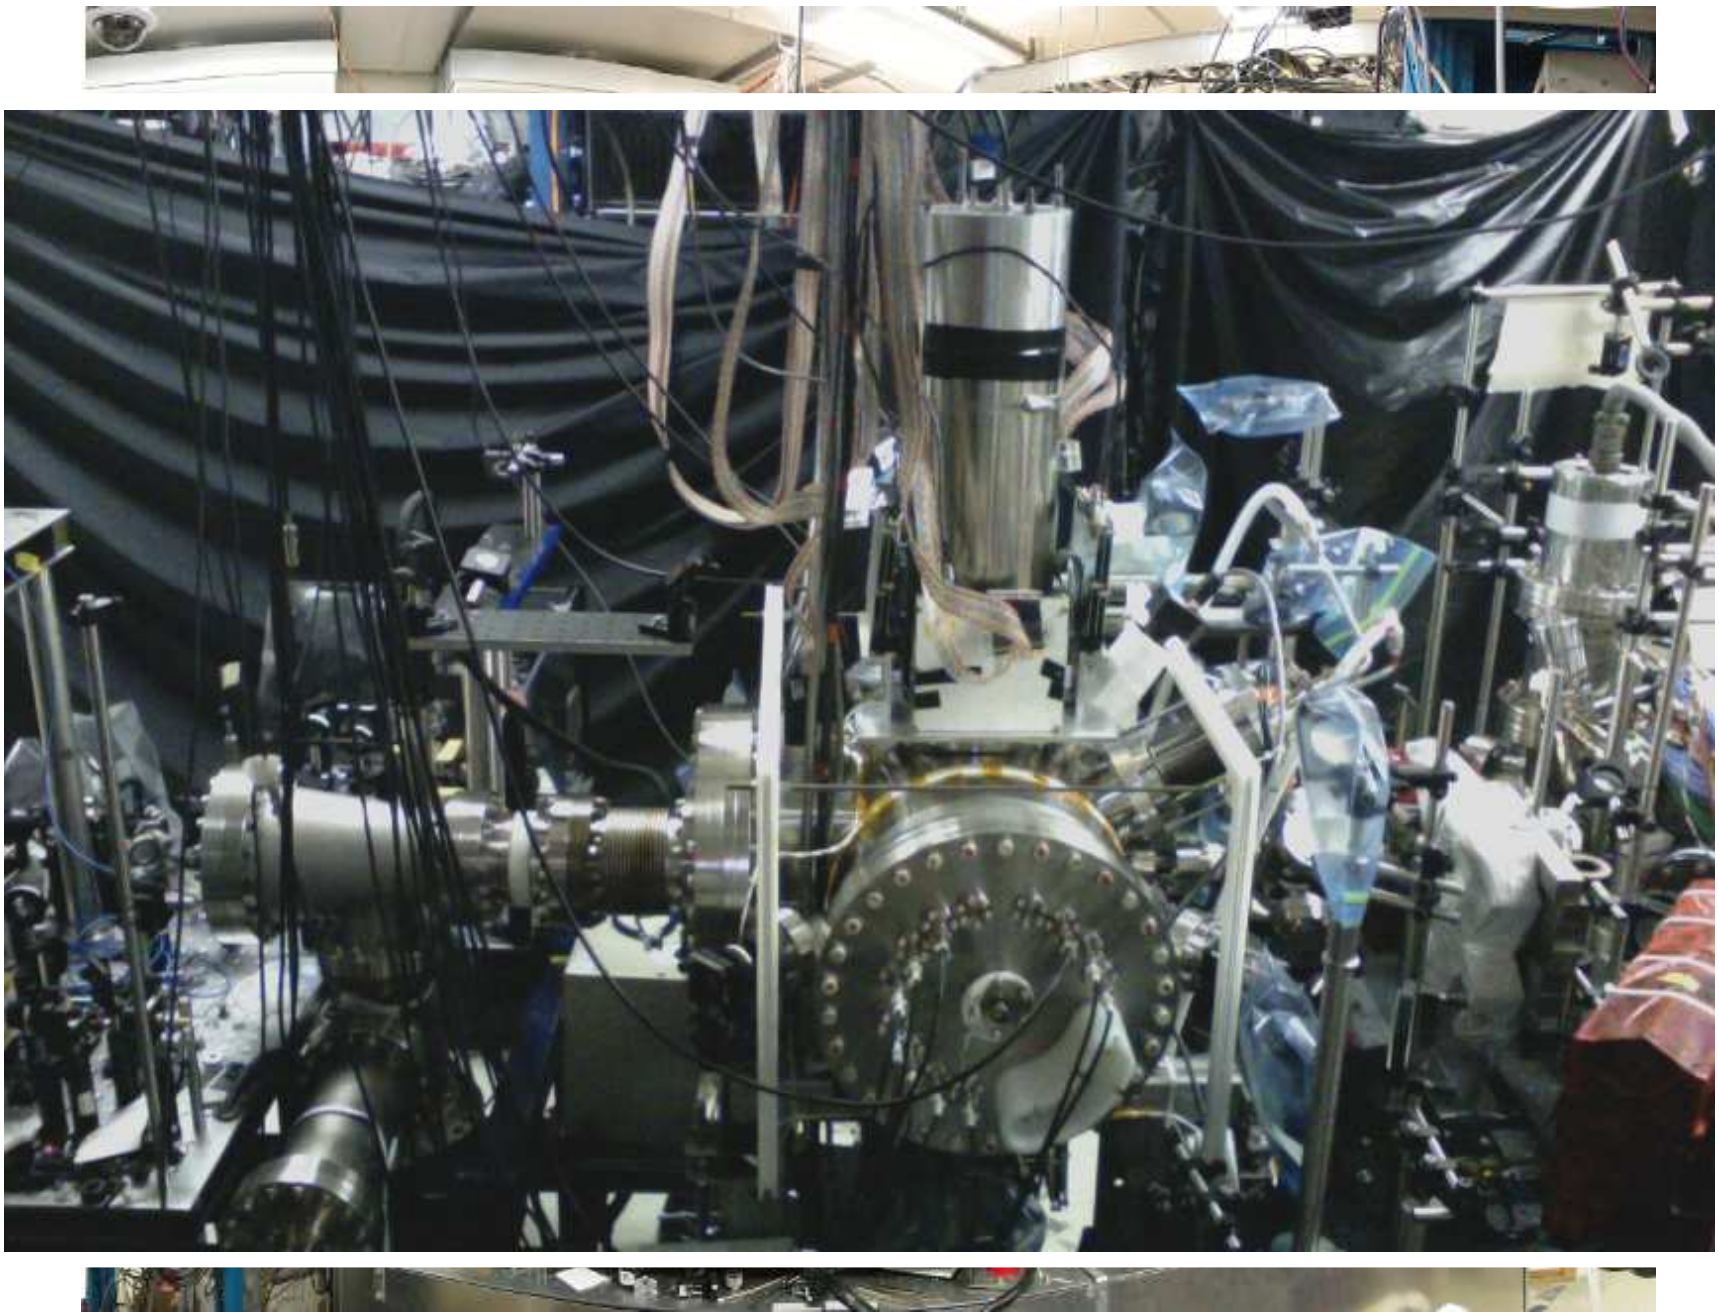
The TRINAT lab

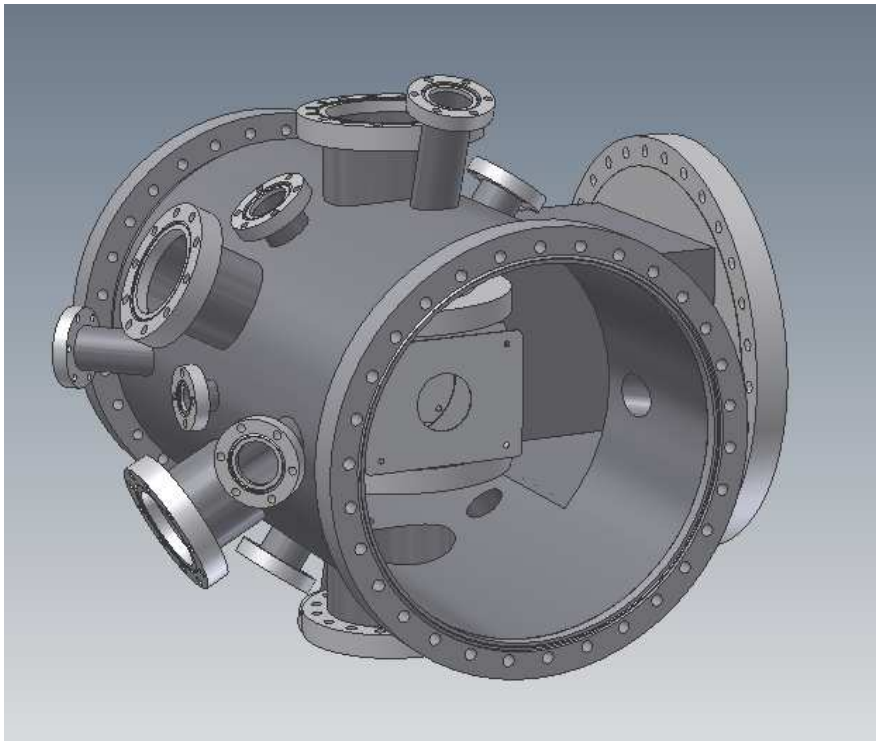




The TRINAT lab

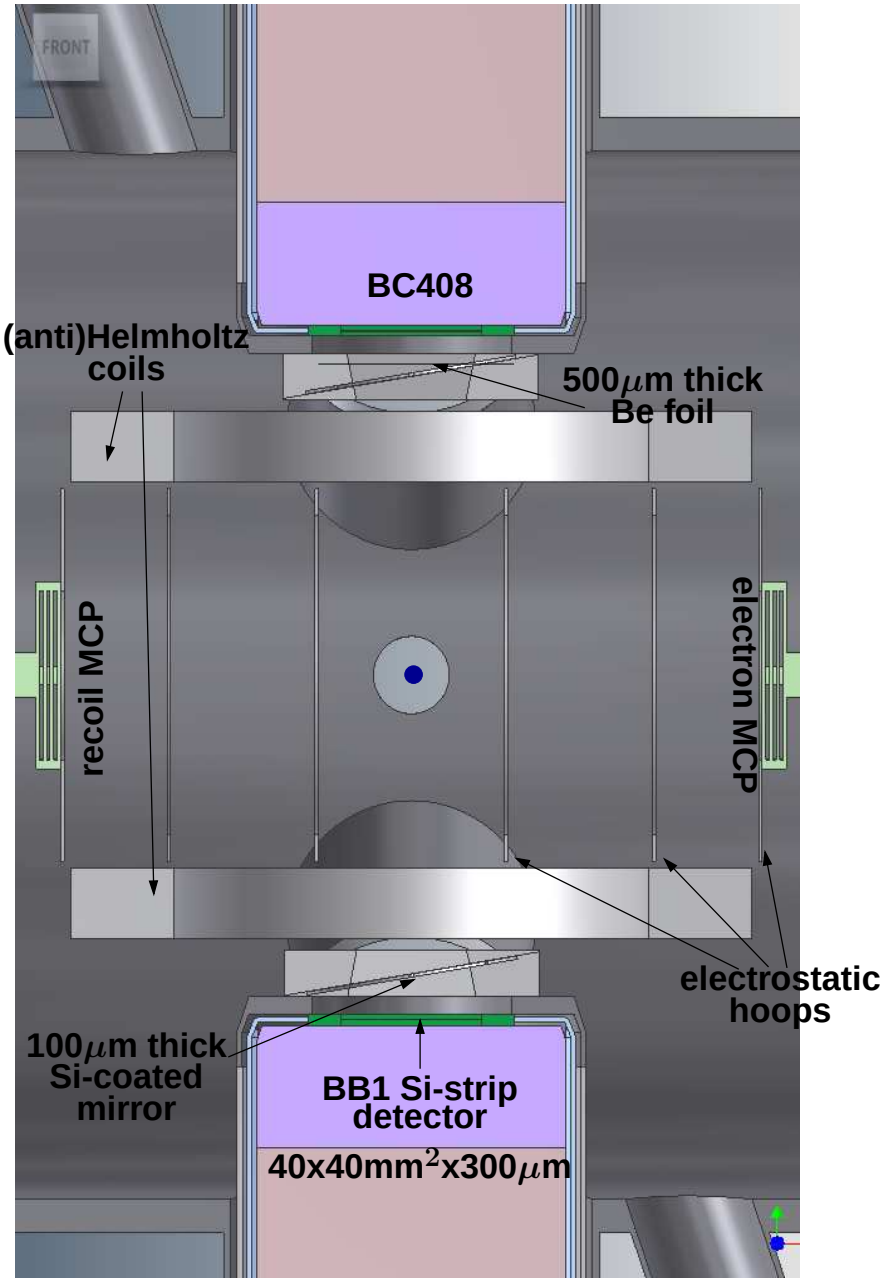


The new chamber

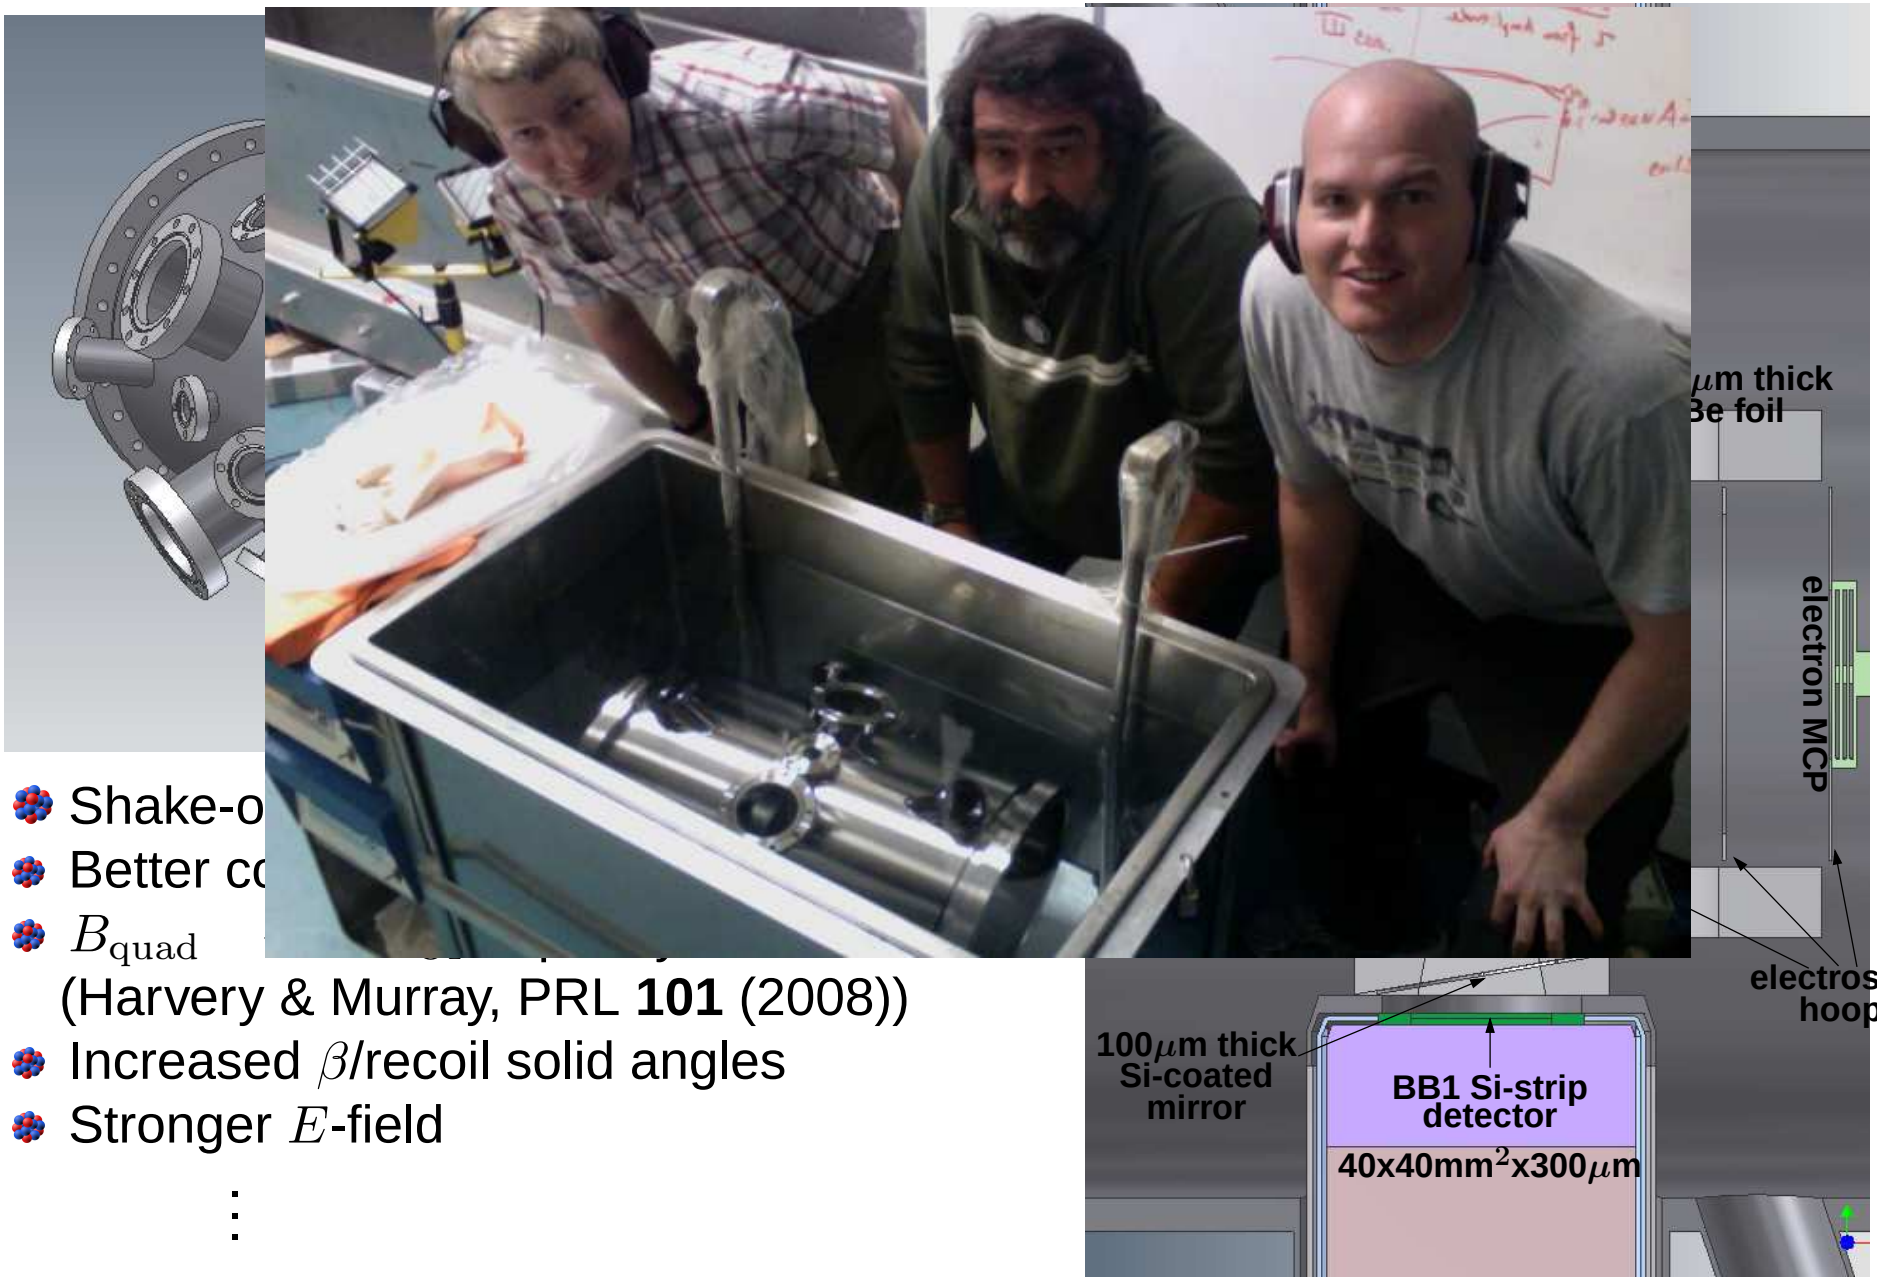


- Shake-off e^- detection
- Better control of OP beams
- $B_{\mathrm{quad}} \rightarrow B_{\mathrm{OP}}$ quickly: AC-MOT (Harvery & Murray, PRL **101** (2008))
- Increased β/recoil solid angles
- Stronger E-field

⋮



The new chamber



- Shake-o
- Better c
- B_{quad}
  (Harvery & Murray, PRL **101** (2008))

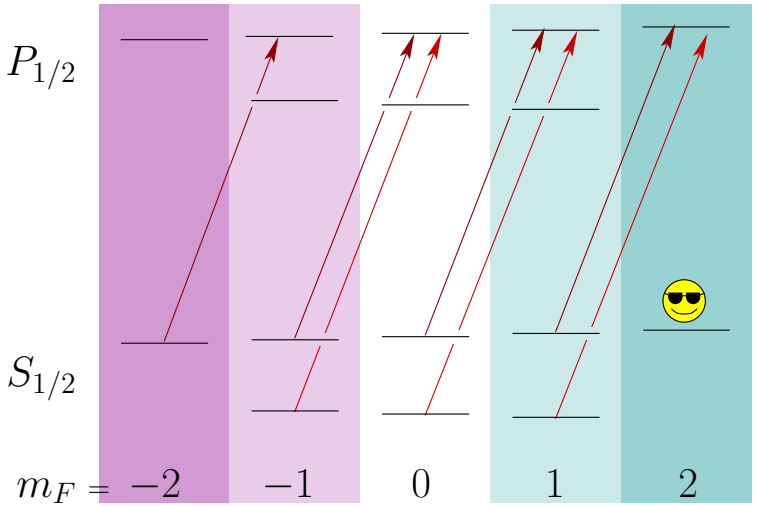
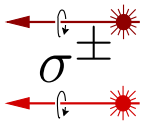
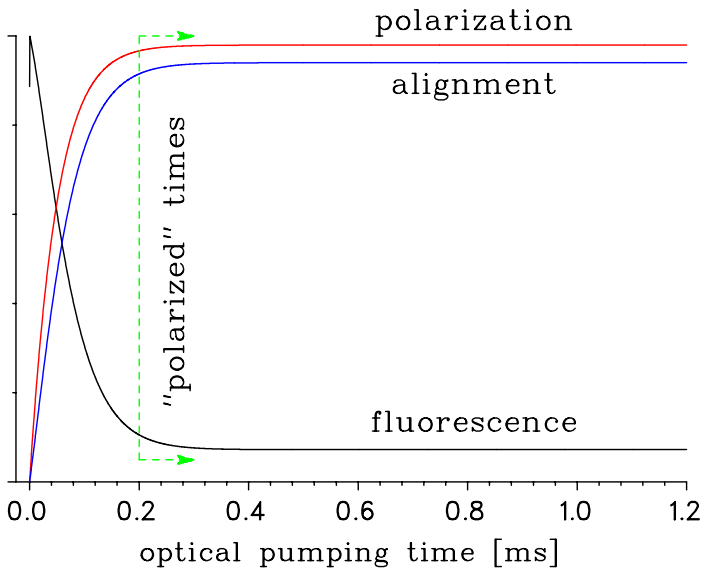
Atomic measurement of P

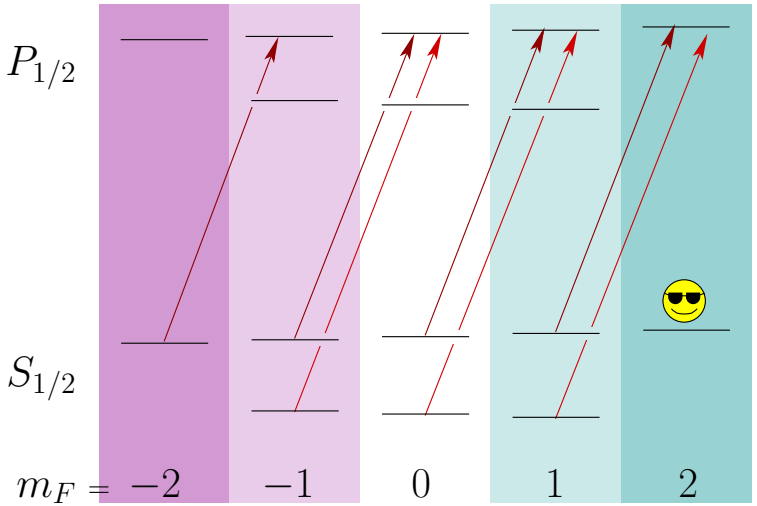


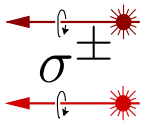


deduce P based on a model of the excited state populations:

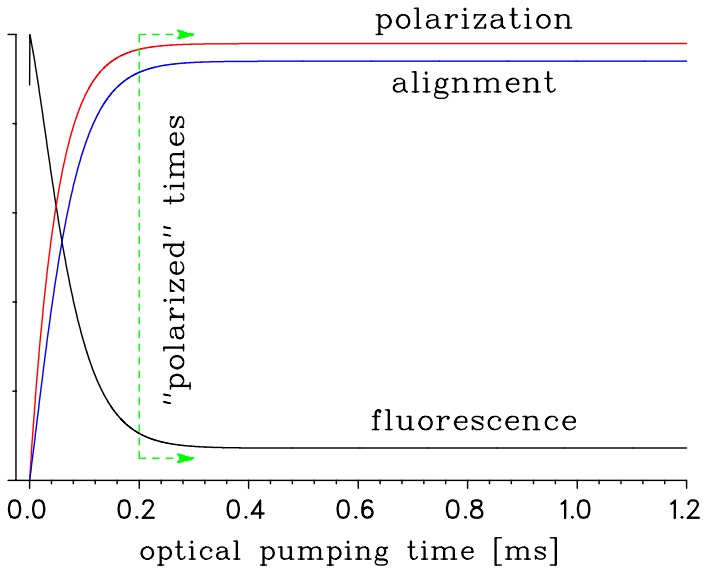


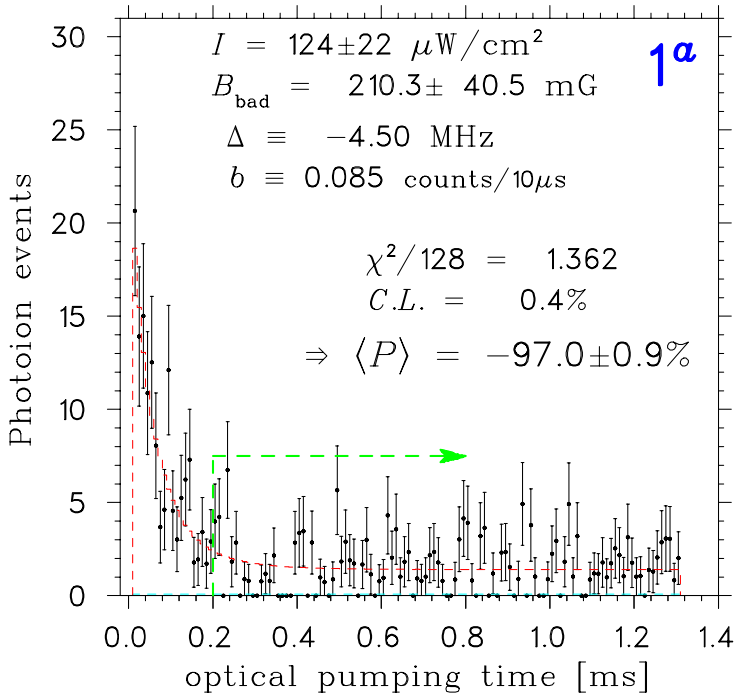
Atomic measurement of P





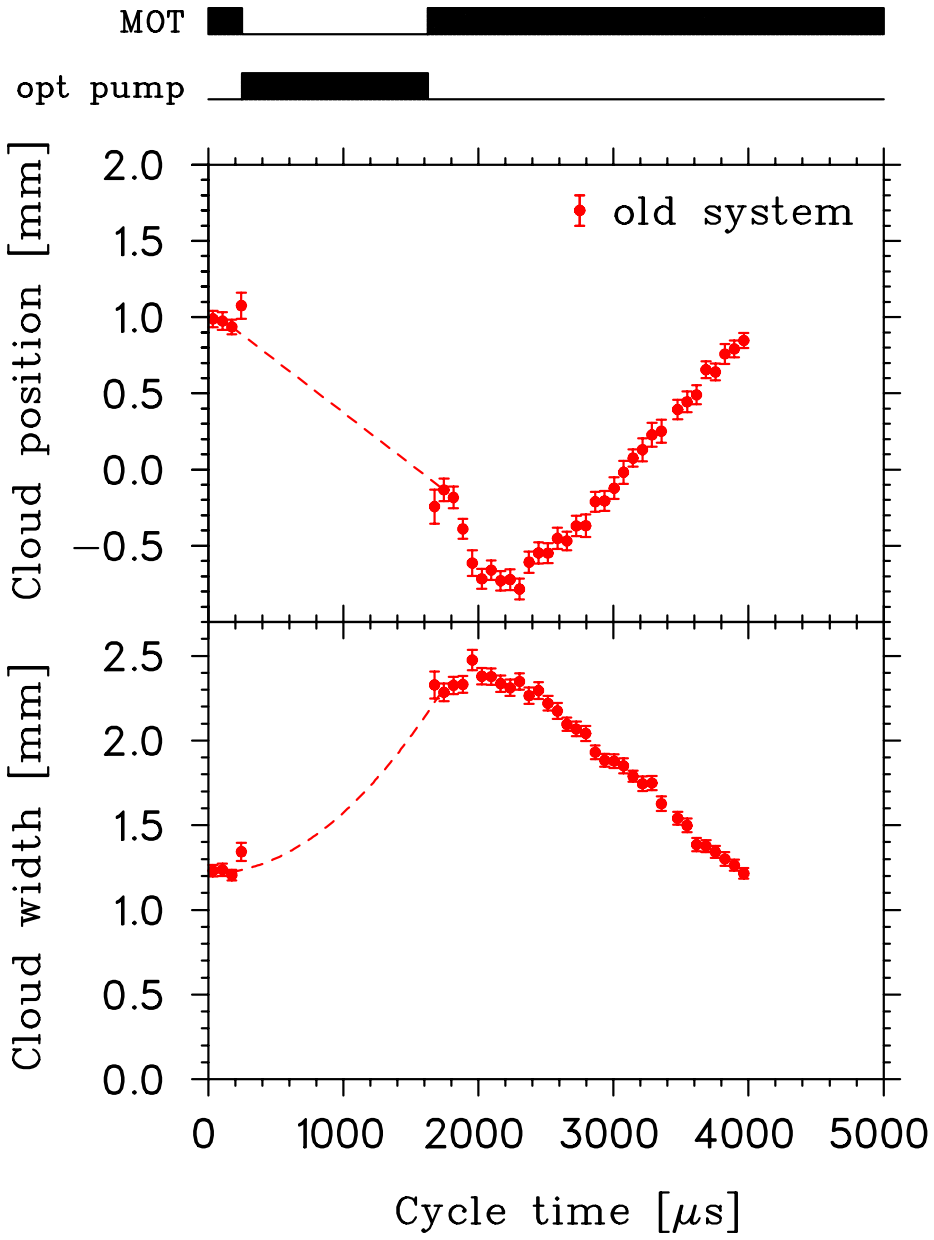
deduce P based on a model of the excited state populations:





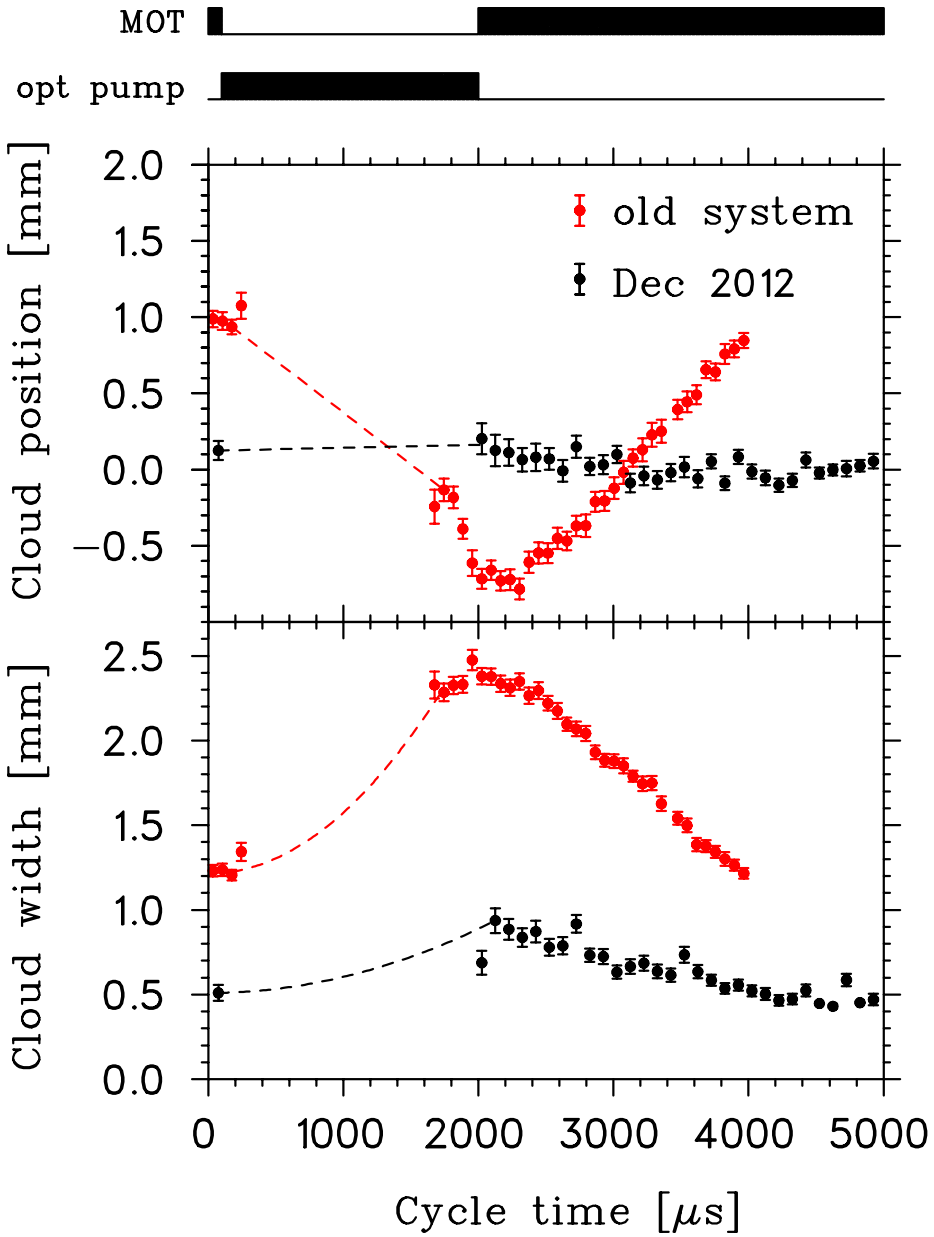
$$\Rightarrow P_{\text{nucl}} = 96.74 \pm 0.53^{+0.19}_{-0.73}$$

The cloud is better controlled now!



- old system:
  - retroreflected beams
  - kludged “Helmholtz” coils
  - eddy currents

The cloud is better controlled now!

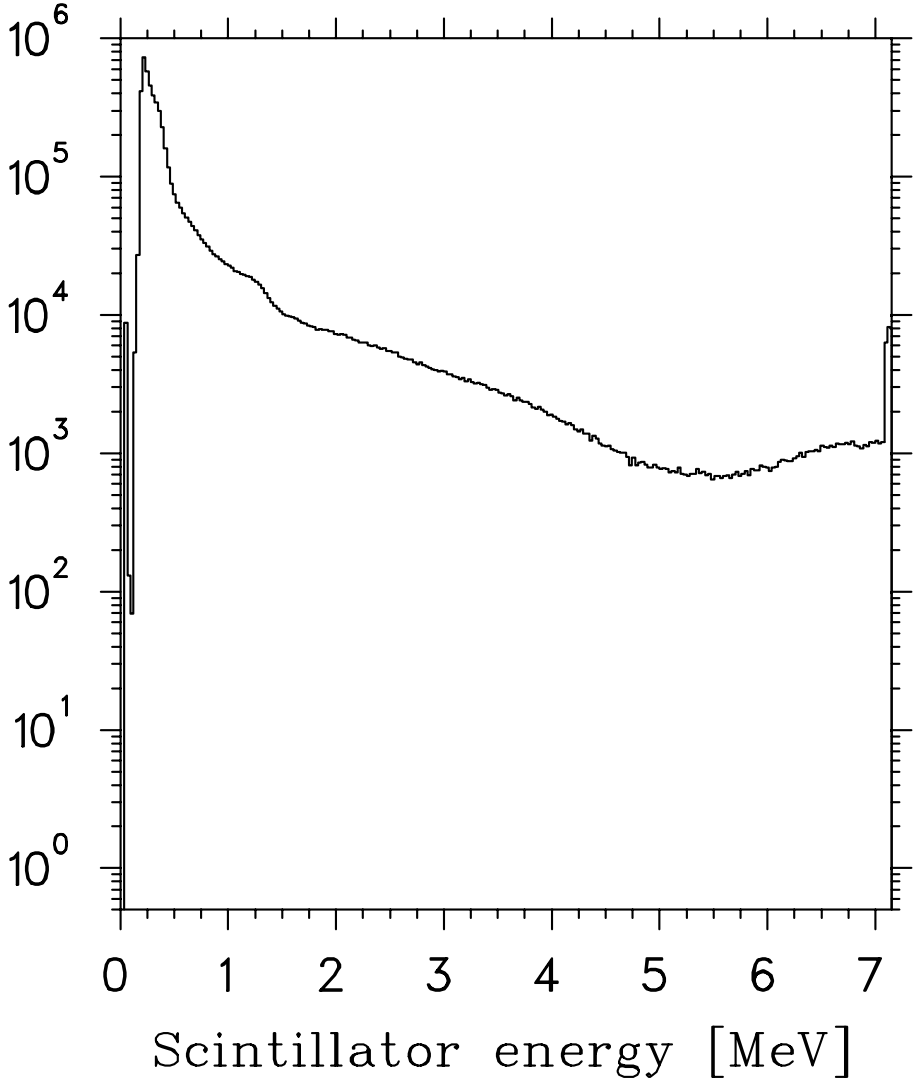


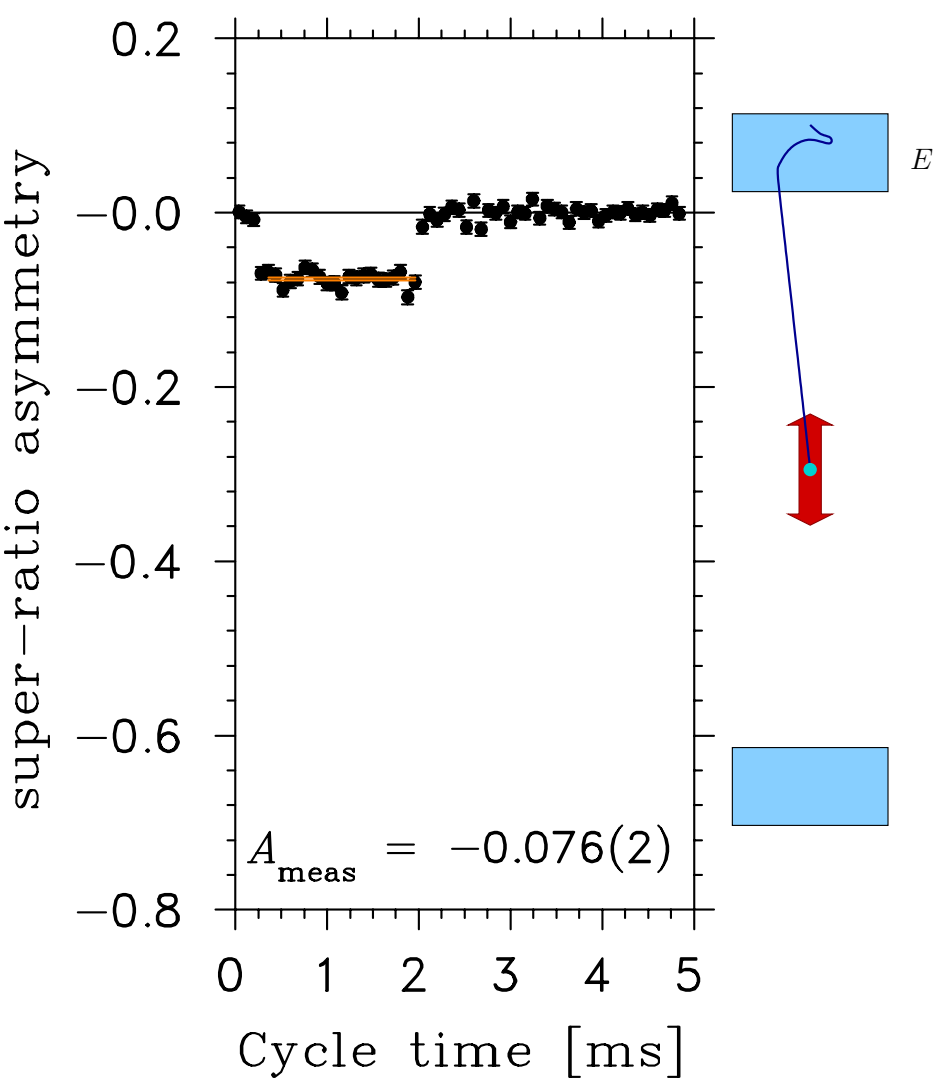
- old system:
  - retroreflected beams
  - kludged “Helmholtz” coils
  - eddy currents
- Dec 2012:
  - beams balanced
  - anti-Helmholtz $\rightarrow$ Helmholtz well-defined fields
  - ac-MOT $\Rightarrow$ fast switching and low eddy currents

much more stable!
lower cloud temperature!

Scintillator spectra — Fall 2012

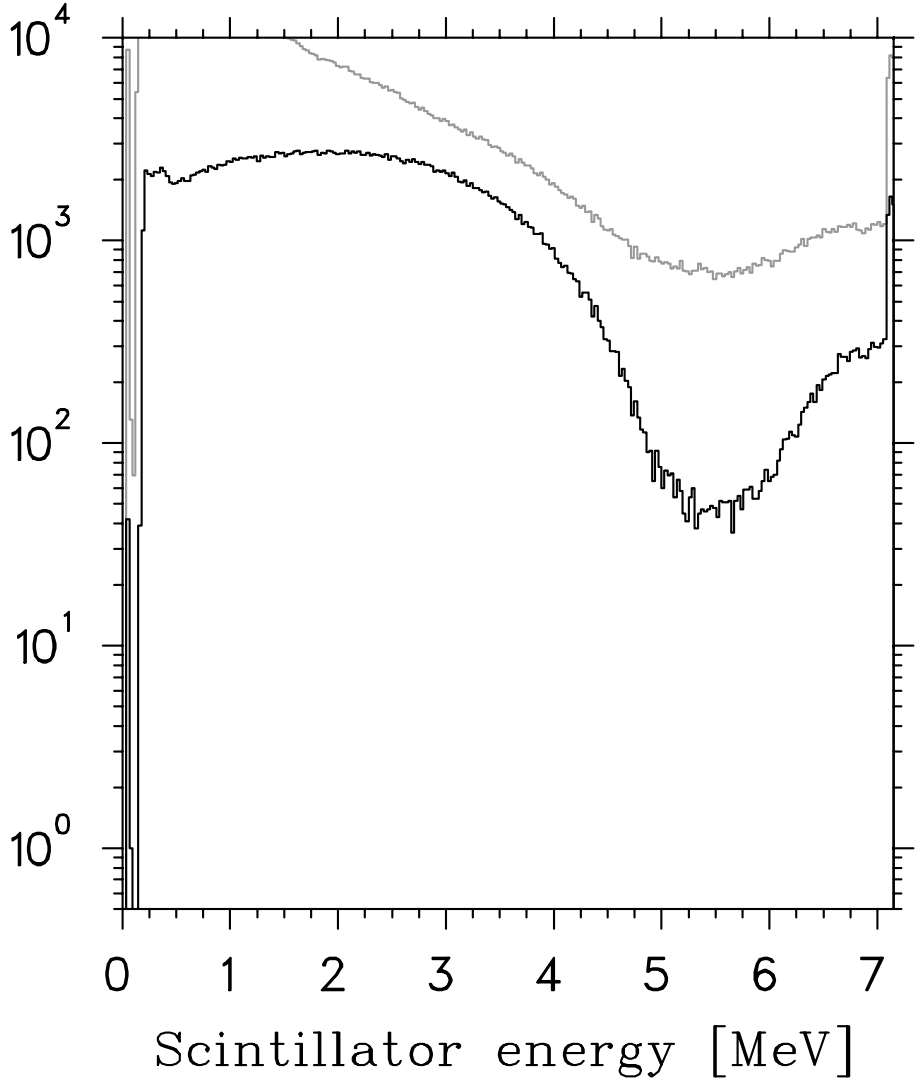
Just the raw data; a slight lower-energy cut to get rid of 511s

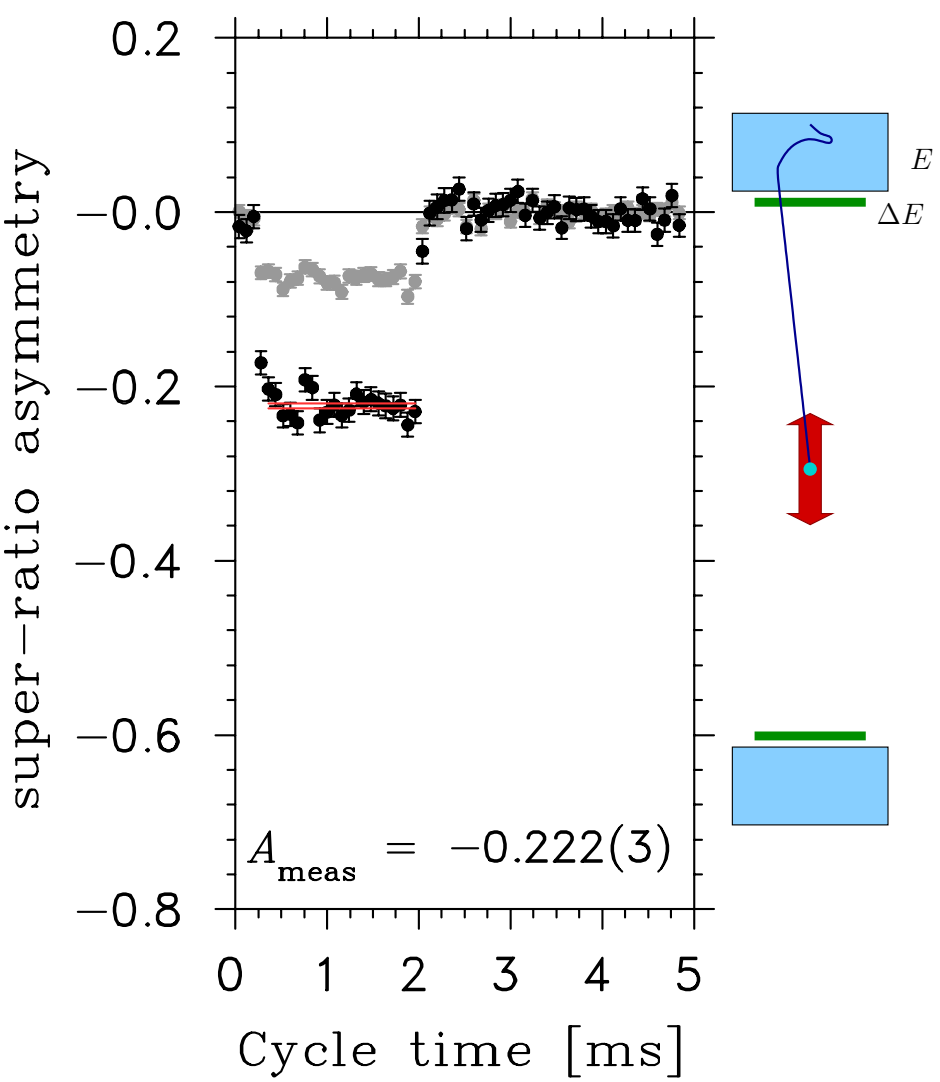




Scintillator spectra — Fall 2012

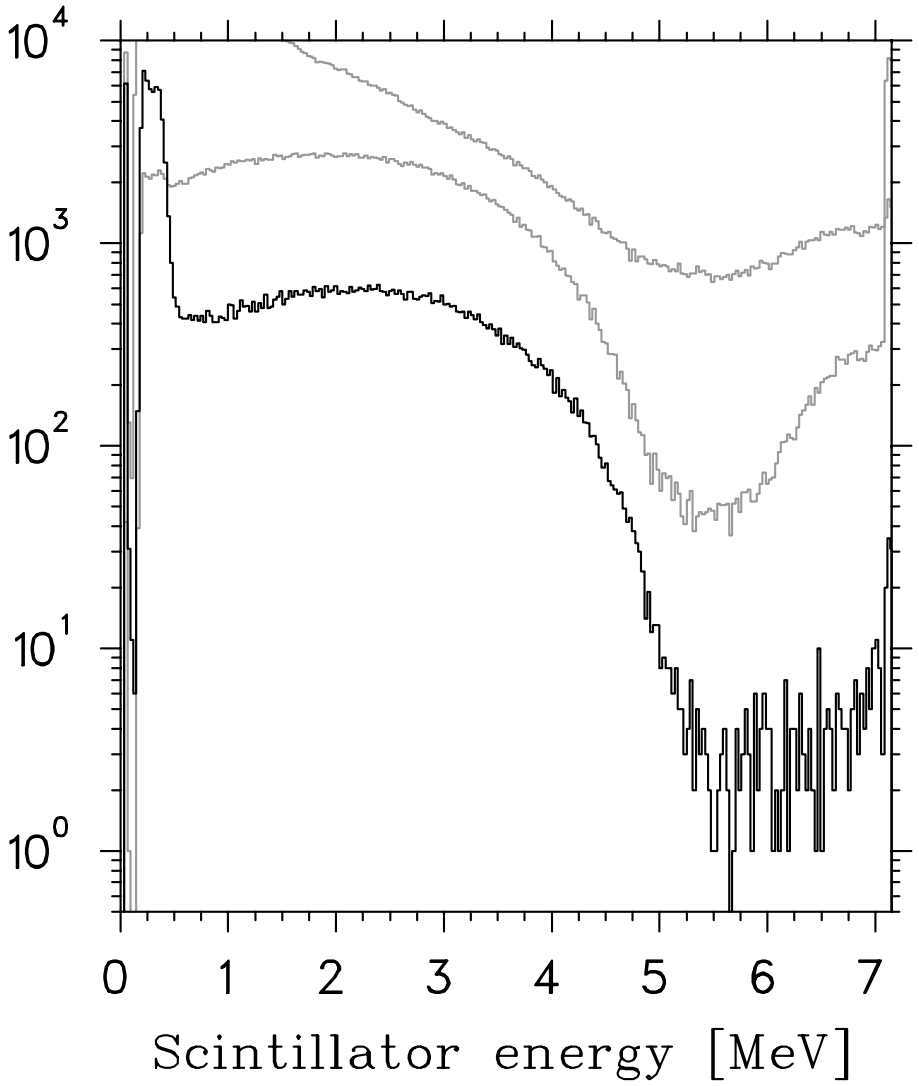
Requiring a ΔE coincidence $\Rightarrow$ remove γs

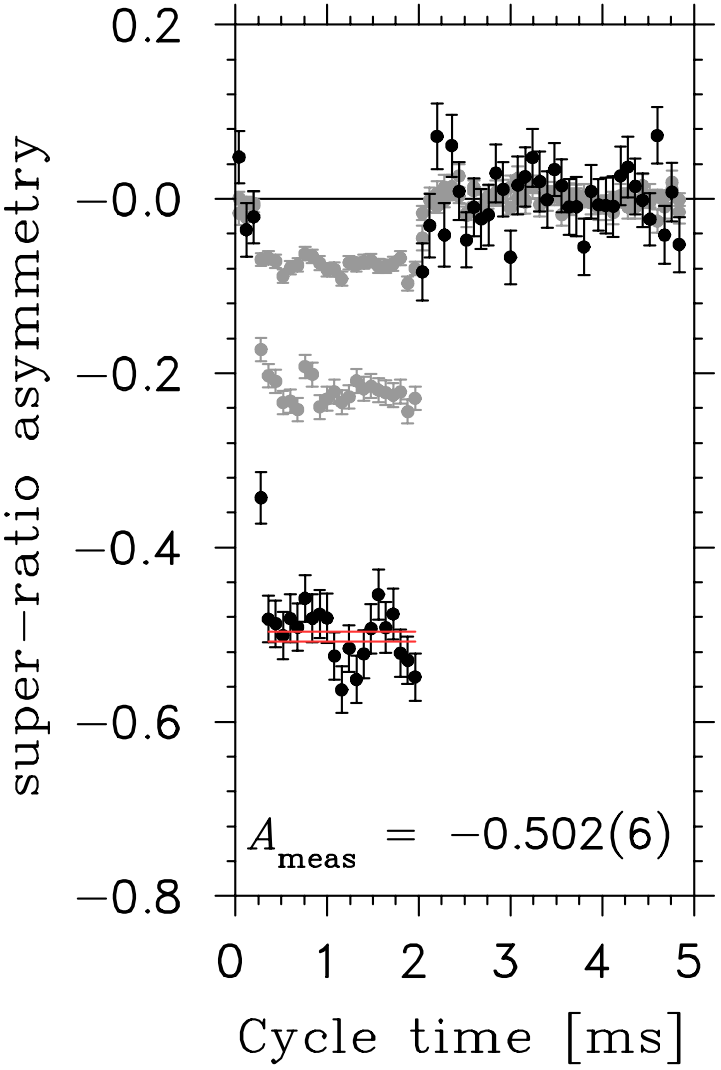


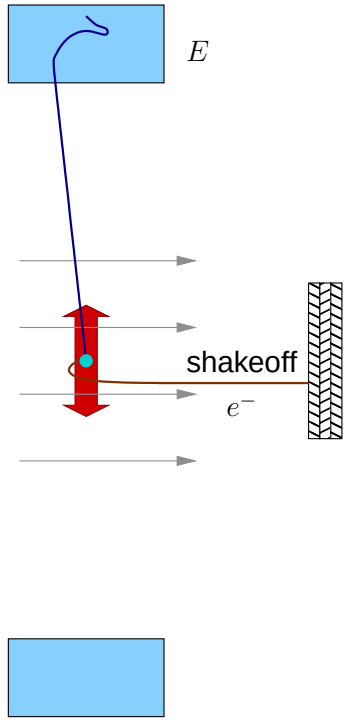


Scintillator spectra — Fall 2012

Requiring a shake-off e^- $\Rightarrow$ decay occured from trap!

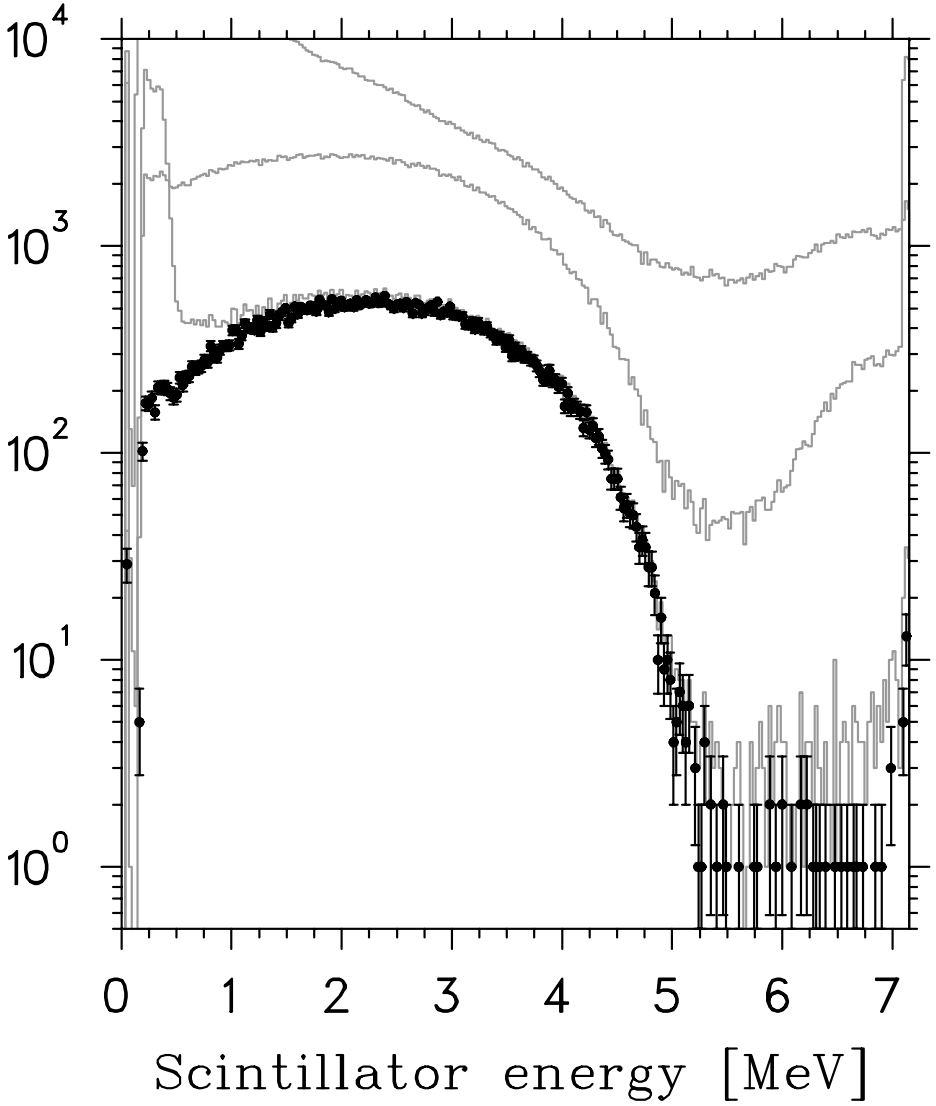


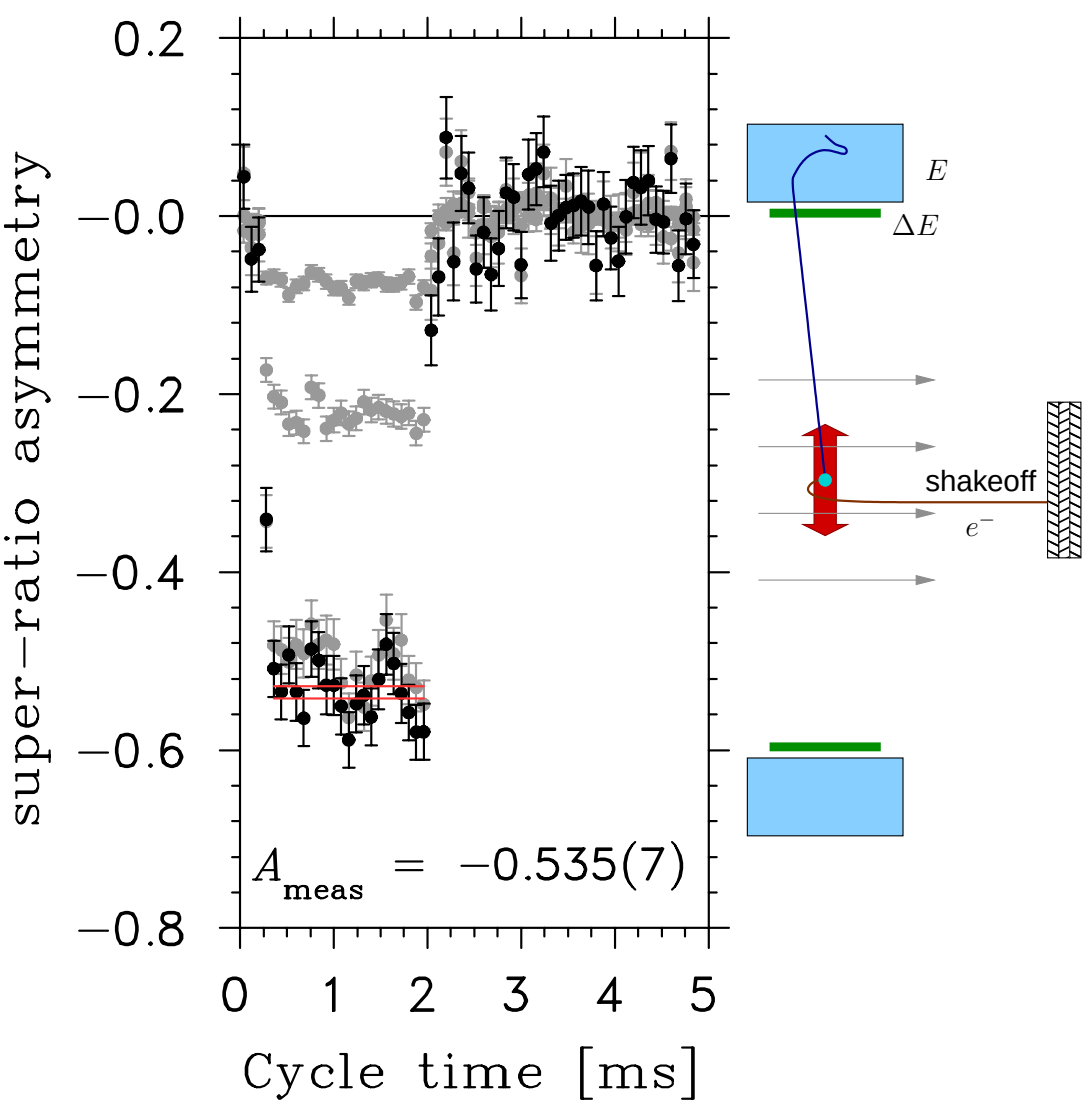




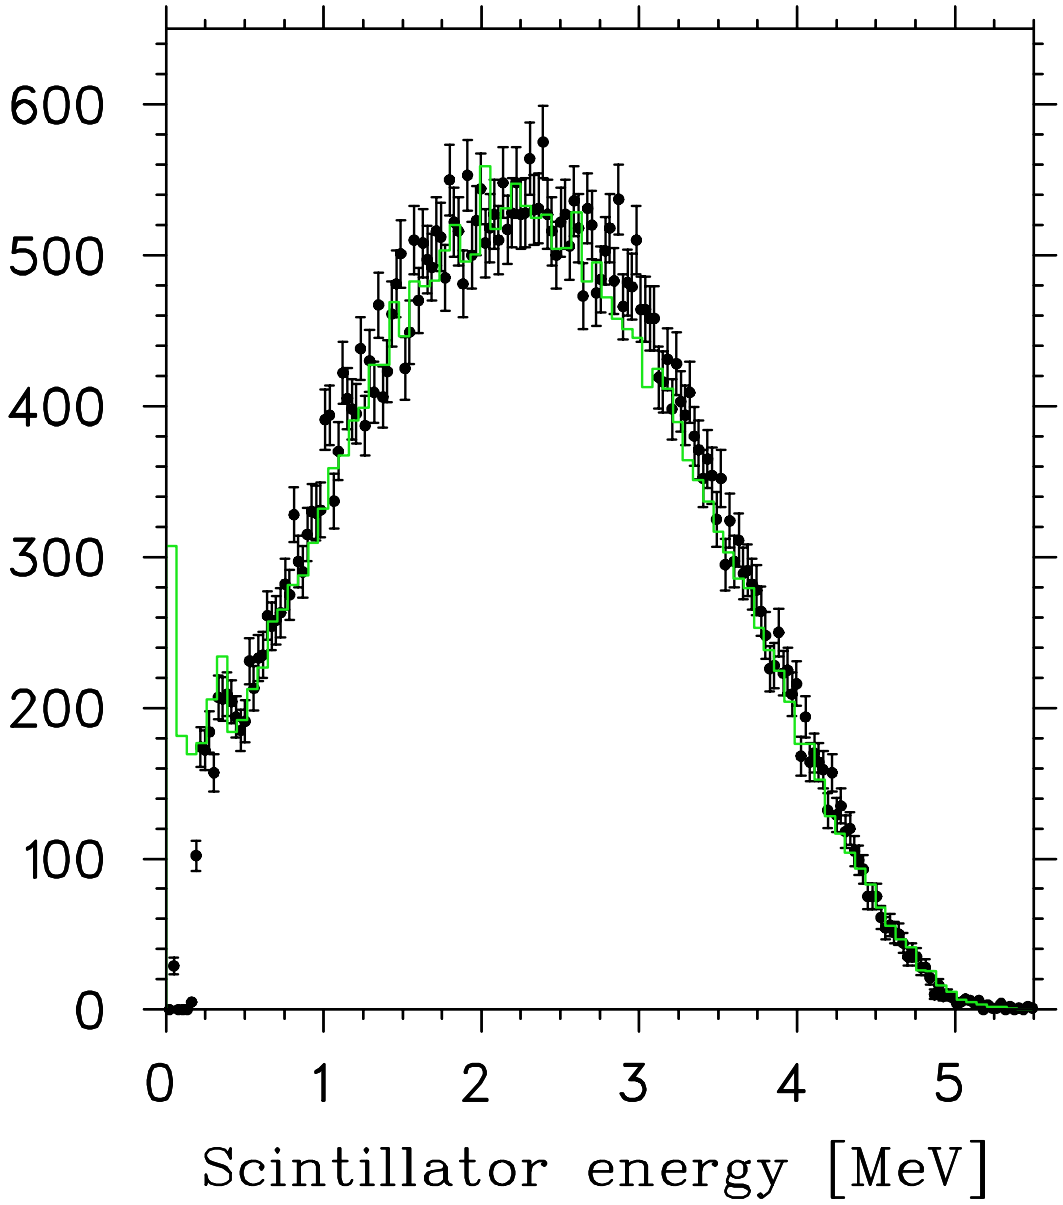
Scintillator spectra — Fall 2012

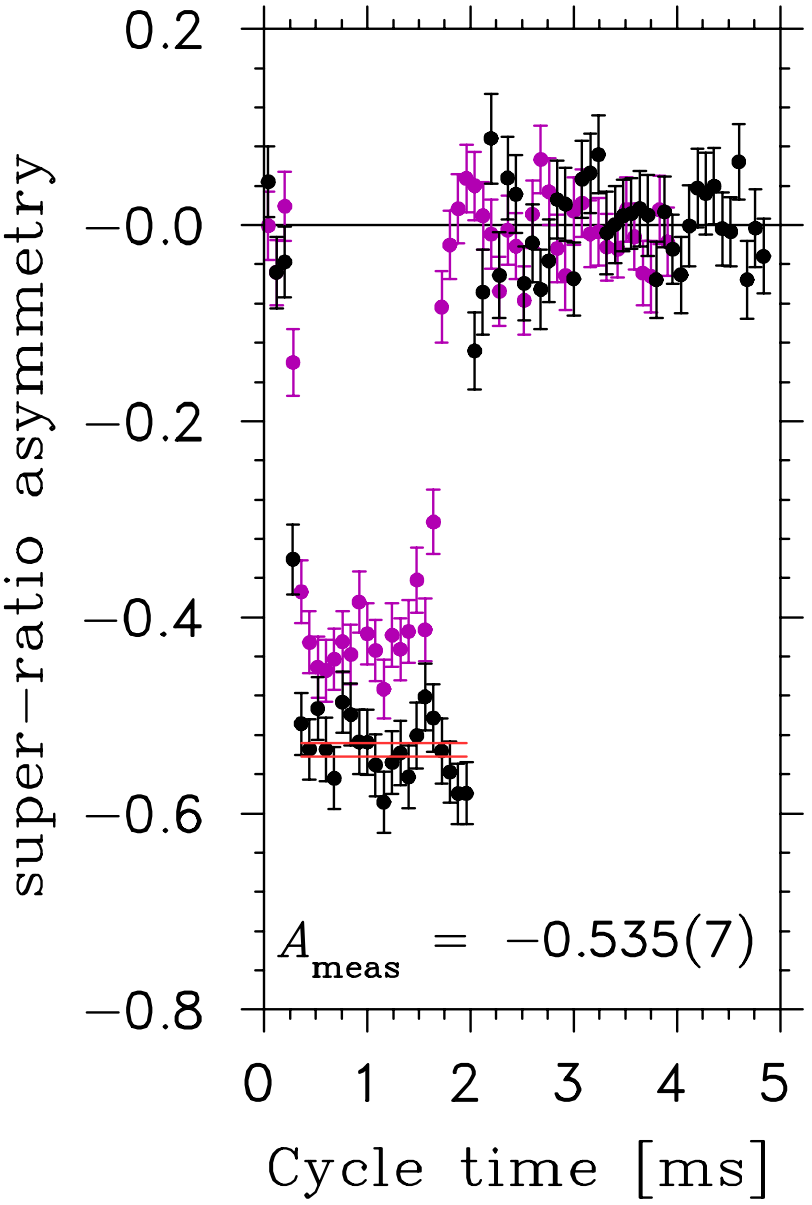
Put in all the basic analysis cuts ⇒ clean spectrum!!



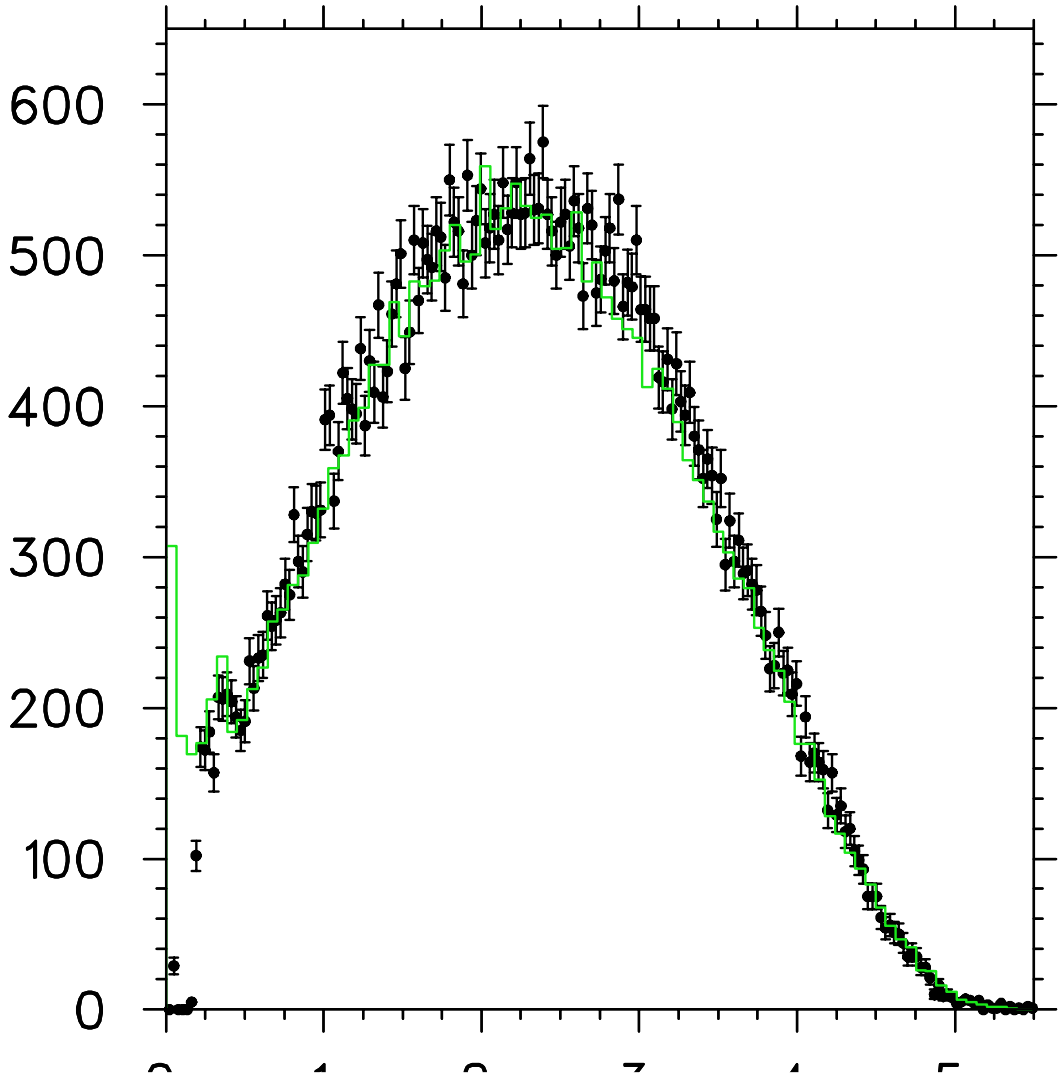


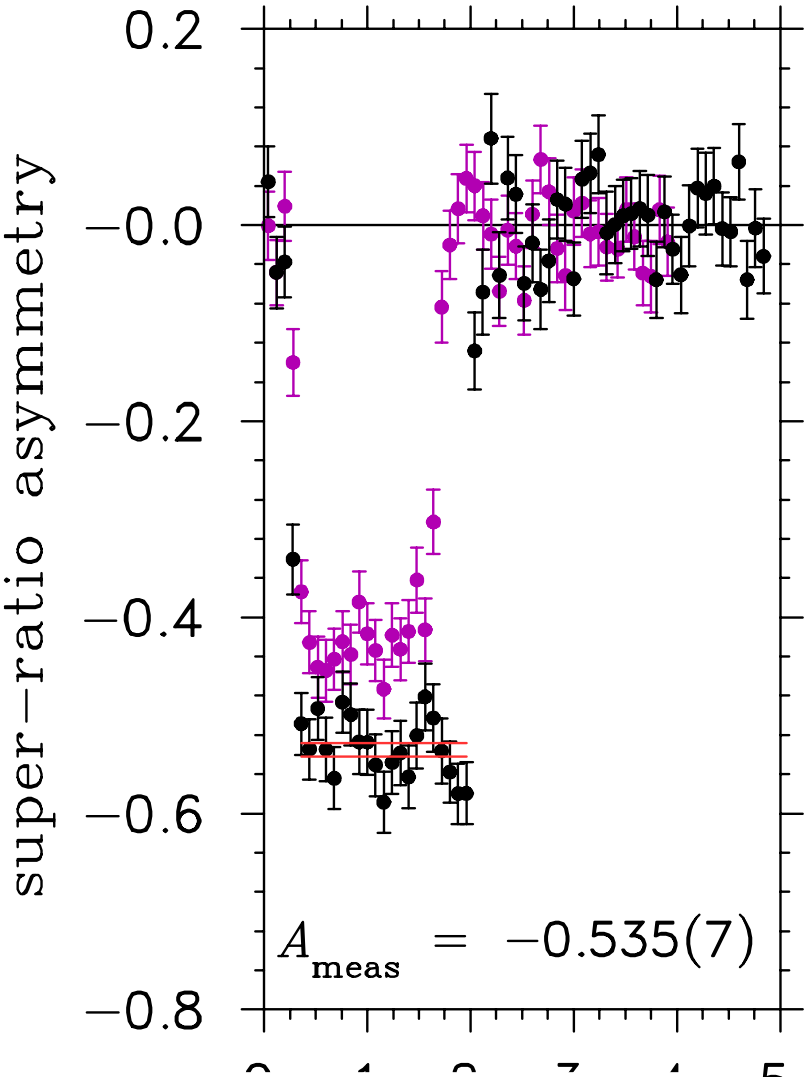
Scintillator spectra — Fall 2012





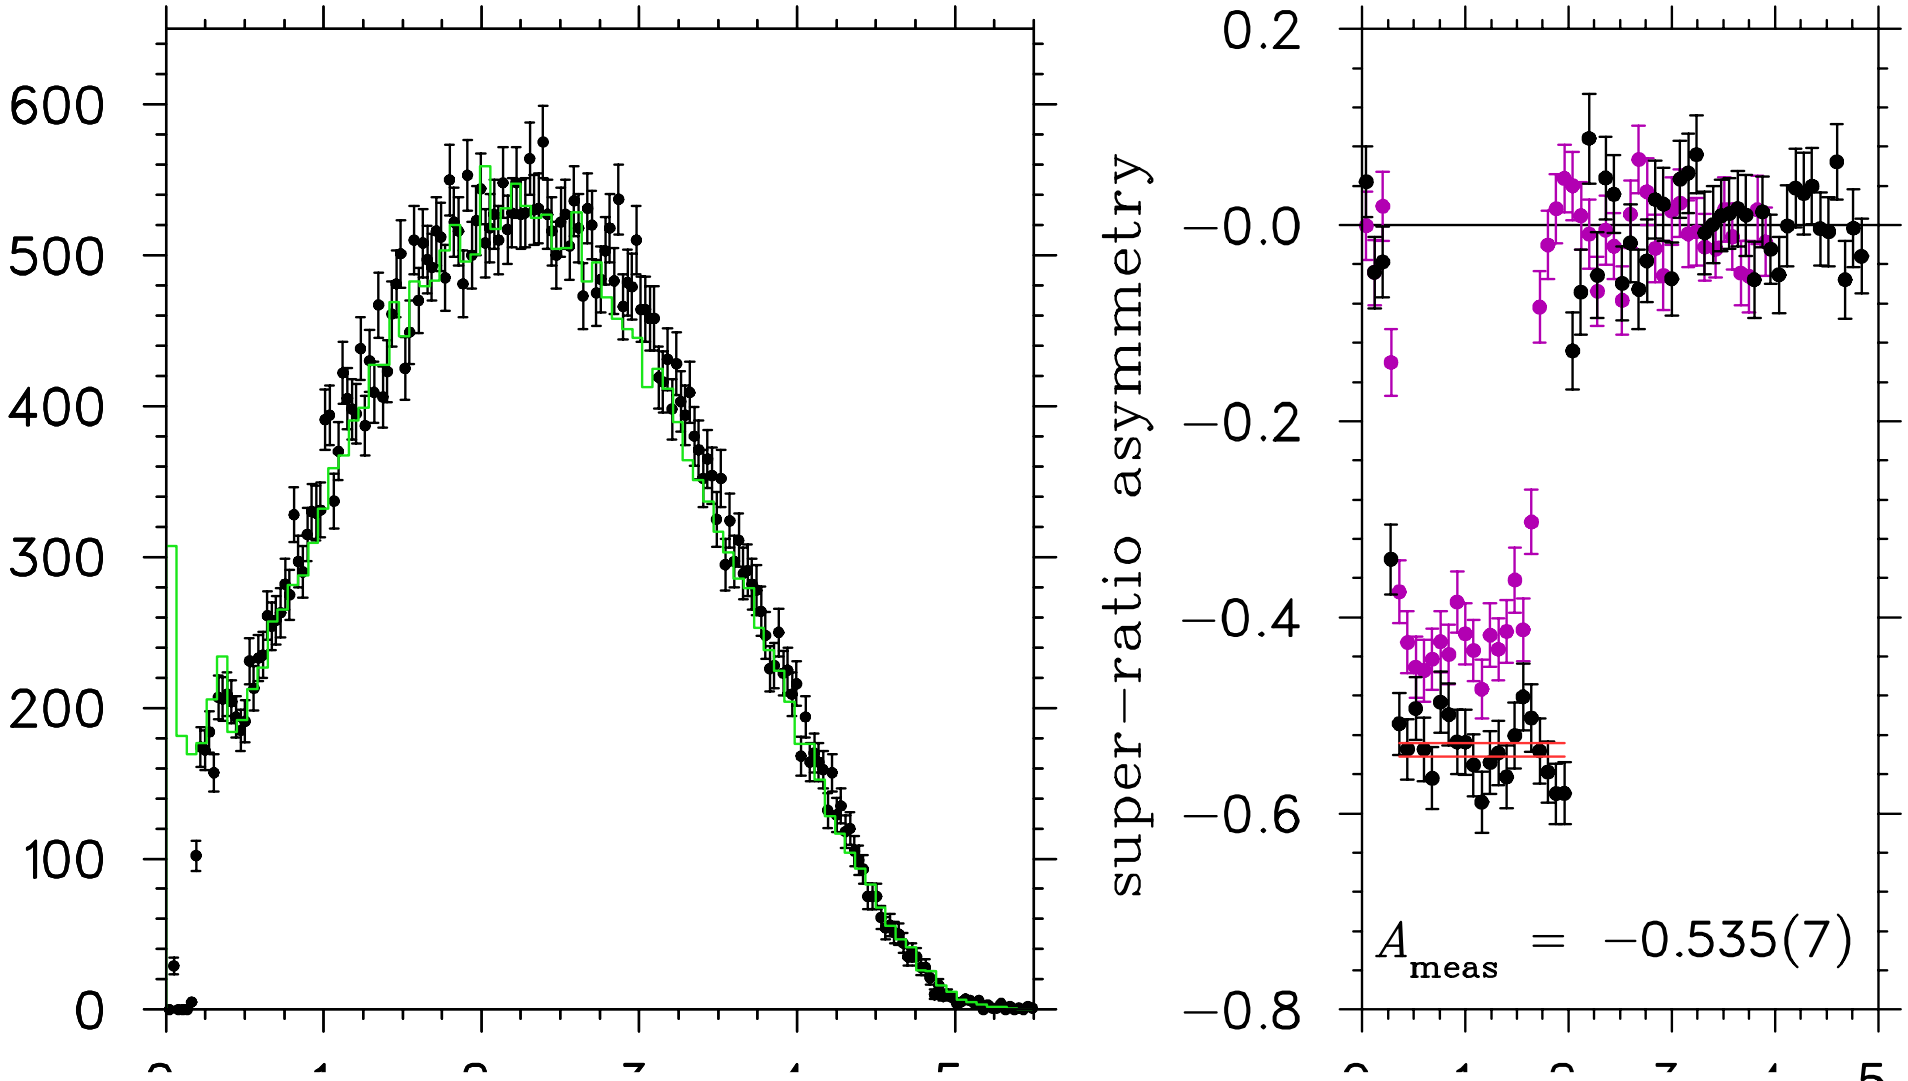
Scintillator spectra — Fall 2012





- Comparison with **GEANT4 simulation** is very good!

Scintillator spectra — Fall 2012



- Comparison with **GEANT4 simulation** is very good!
- Much higher asymmetry observed compared to 1st attempt!

Summary

- SM is fantastic, but **not** our “ultimate” theory
- many exciting avenues to find more a complete model

Summary

- SM is fantastic, but **not** our “ultimate” theory
- many exciting avenues to find more a complete model

- **nuclear approach:** precision measurement of correlation parameters

Summary

- SM is fantastic, but **not** our “ultimate” theory
- many exciting avenues to find more a complete model

- **nuclear approach:** precision measurement of correlation parameters

- Penning trap + RIB CI = ***cool*** physics
- (AC-)MOT + opt. pumping = ***cool*** physics
