

Searching for BSM physics via the precision frontier: β decay experiments using atom and ion traps

Cyclotron Institute
TEXAS A&M
UNIVERSITY

Outline

● Introduction

- ★ Testing the standard model via the precision frontier
- ★ Angular correlations of β decay

● ^{37}K at TRIUMF

- ★ The TRINAT facility
- ★ Polarizing the cloud
- ★ Recent measurement of A_β

● TAMUTRAP

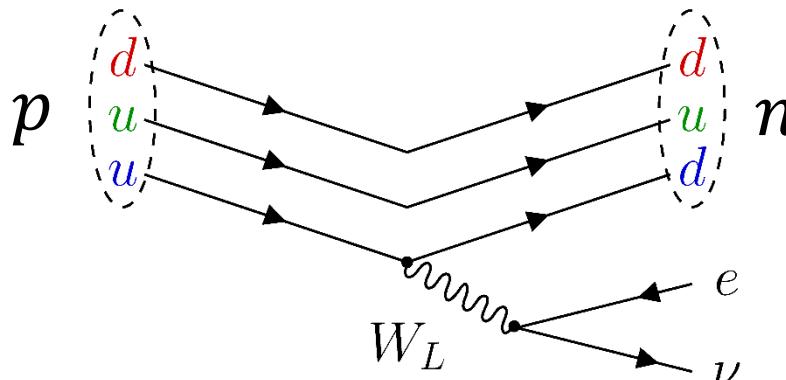

- ★ $T = 2$ decays to test the SM
- ★ Source production and commissioning mass measurements

● ^6He b_{Fierz} at UW

- ★ Cyclotron radiation emission spectroscopy
- ★ Plans to implement an ion trap to remove wall collisions

The standard model and beyond

- This is the standard model:

pure $V - A$ interaction

$$H_\beta = \bar{p} \gamma_\mu n (C_V \bar{e} \gamma^\mu \nu + C'_V \bar{e} \gamma^\mu \gamma_5 \nu) - \bar{p} \gamma_\mu \gamma_5 n (C_A \bar{e} \gamma^\mu \gamma_5 \nu + C'_A \bar{e} \gamma^\mu \nu)$$

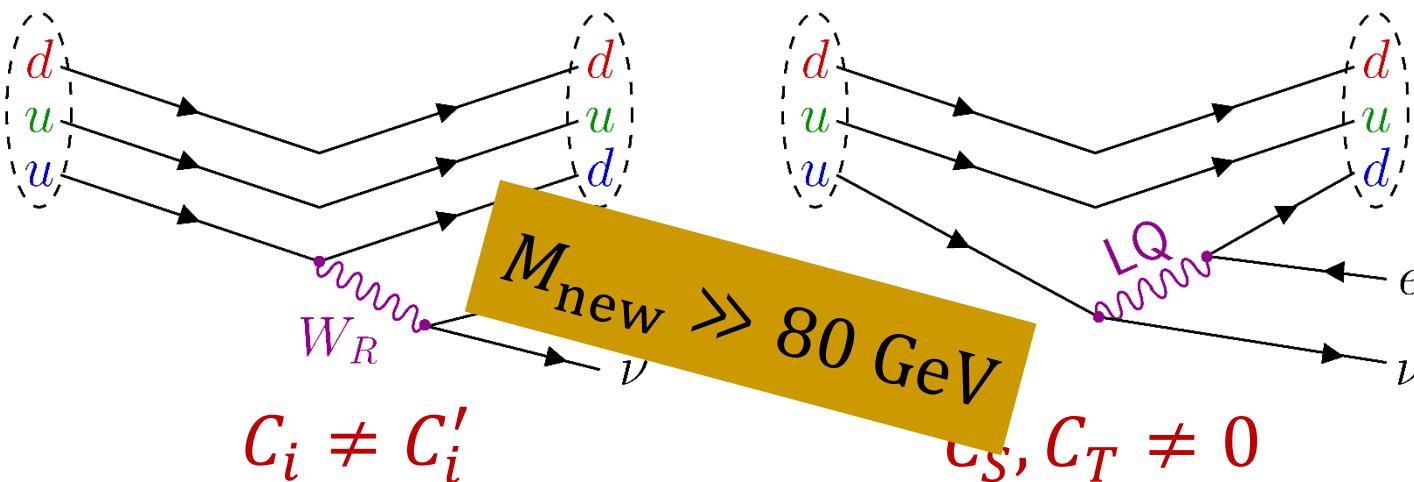

$$C_V = C'_V = 1$$

$$C_A = C'_A \approx 1.27$$

$$M_W = 80.385 \text{ GeV}$$

- These are not:

Right-handed bosons, or scalar/tensor leptoquarks, or SUSY, or...

- Profumo, Ramsey-Musolf, Tulin, Phys. Rev. D **75**, 075017 (2007)
- Vos, Wilschut, Timmermans, Rev. Mod. Phys. **87**, 1483 (2015)
- Bhattacharya *et al.*, Phys. Rev. D **94**, 054508 (2016)

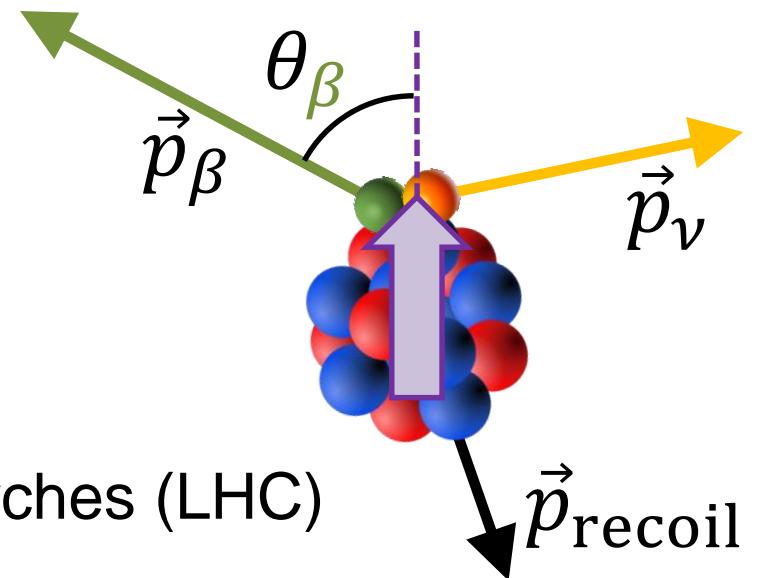

The precision frontier

- Goal:

- To complement high-energy experiments by pushing the precision frontier
- Angular correlations in β decay: values sensitive to new physics

- Global gameplan:

- Measure the β -decay parameters
- Compare to SM predictions
- Look for deviations \Leftrightarrow new physics
- Precision of $\leq 0.1\%$ needed to complement other searches (LHC)

Naviliat-Cuncic and Gonzalez-Alonso, Ann Phys **525**, 600 (2013)

Cirigliano, Gonzalez-Alonso and Graesser, JHEP **1302**, 046 (2013)

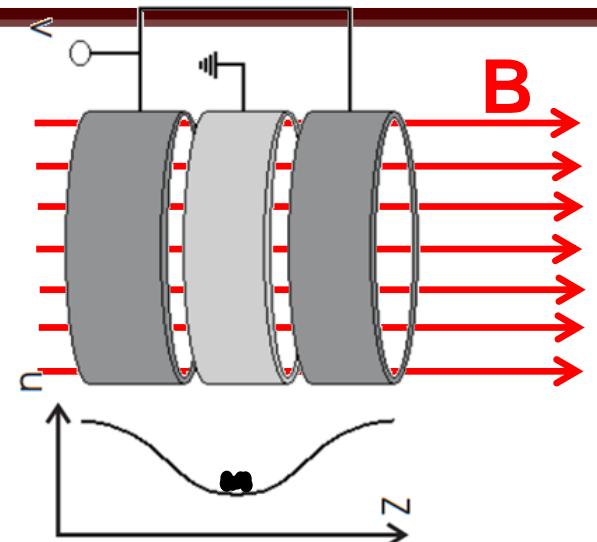

Vos, Wilschut and Timmermans, RMP **87**, 1483 (2015)

González-Alonso, Naviliat-Čunčić and Severijns, Prog. Part. Nucl Phys **104**, 165 (2019)

0.1% is a tall order...how to reach that precision?

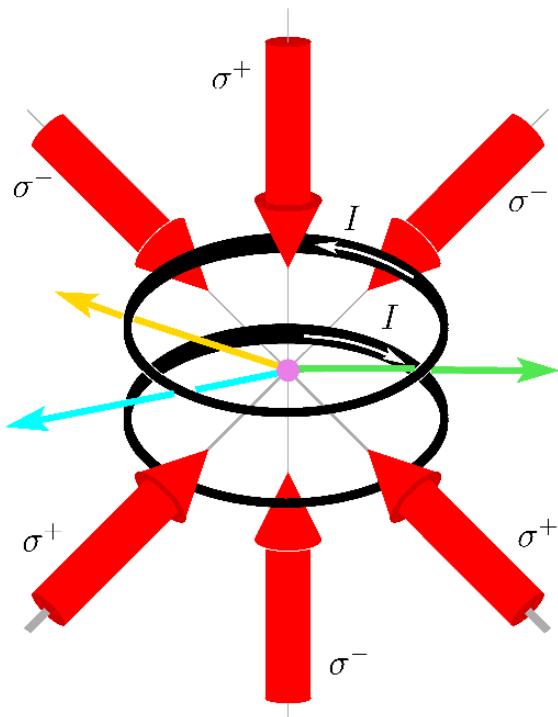

- Ion traps

- Can trap **any** ion; well-known for mass measurements (CPT, ISOLTRAP, JYFLTRAP, LEBIT, TITAN,...)
- Beta-Decay Paul Trap @ ANL
 - β - ν correlation of ${}^8\text{Li}$ to 1%; poised to reach 0.1% precision
- No other correlation experiments completed yet, but a number planned:
 - TAMUTRAP @ Texas A&M (${}^{20}\text{Mg}$, ${}^{24}\text{Si}$, ${}^{28}\text{S}$, ${}^{32}\text{Ar}$; ${}^{36}\text{Ca}$, ${}^{40}\text{Ti}$)
 - LPCTrap @ GANIL (${}^6\text{He}$)
 - EIBT @ Weizmann Institute → SARAF (${}^6\text{He}$ to start)
 - NSLTrap @ Notre Dame (${}^{11}\text{C}$, ${}^{13}\text{N}$, ${}^{15}\text{O}$, ${}^{17}\text{F}$)

- Magneto-optical traps

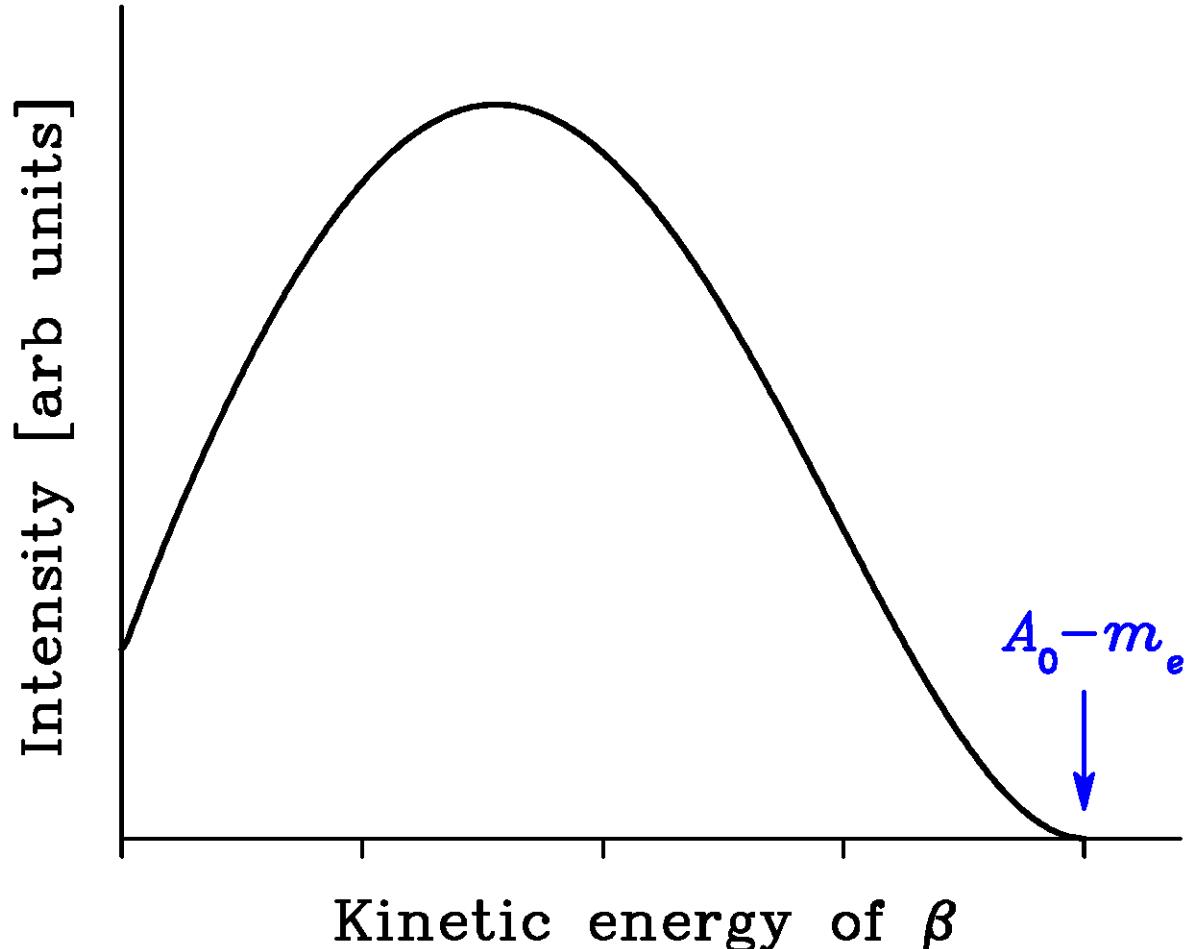

- Atoms are cold and confined to a small volume
- TRINAT @ TRIUMF (K isotopes)
- ${}^6\text{He}$ @ UW
- NeAT @ SARAF (Ne isotopes)

How does β decay test the SM?

- Begin by looking at the basic decay rate

$$\frac{dW}{dE_e} = \overbrace{\frac{G_F^2 |\mathbf{V}_{ud}|^2}{(2\pi)^5} p_e E_e (A_0 - E_e)^2}^{\text{basic decay rate}}$$

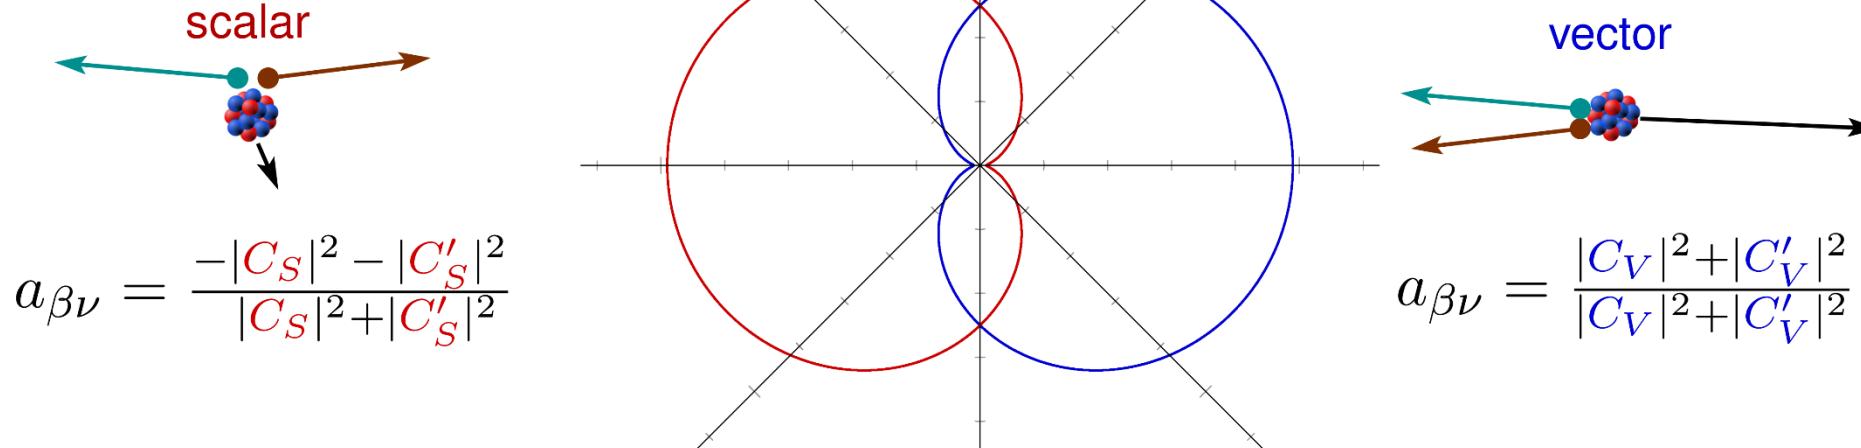

β decay and fundamental physics

- Expand to the often-quoted angular distribution of the decay
(Jackson, Treiman and Wyld, Phys Rev **106** and Nucl Phys **4**, 1957)

$$\frac{d^5W}{dE_e d\Omega_e d\Omega_{\nu_e}} = \overbrace{\frac{G_F^2 |\mathbf{V}_{ud}|^2}{(2\pi)^5} p_e E_e (A_o - E_e)^2}^{\text{basic decay rate}} \xi \left(1 + \overbrace{\mathbf{a}_{\beta\nu} \frac{\vec{p}_e \cdot \vec{p}_{\nu_e}}{E_e E_{\nu_e}}}^{\beta-\nu \text{ correlation}} + \overbrace{\mathbf{b} \frac{\Gamma m_e}{E_e}}^{\text{Fierz term}} \right)$$

$$a_{\beta\nu} = \frac{|\mathbf{C}_V|^2 + |\mathbf{C}'_V|^2 - |\mathbf{C}_S|^2 - |\mathbf{C}'_S|^2}{|\mathbf{C}_V|^2 + |\mathbf{C}'_V|^2 + |\mathbf{C}_S|^2 + |\mathbf{C}'_S|^2} = 1??$$

β decay and fundamental physics

- Expand to the often-quoted angular distribution of the decay
(Jackson, Treiman and Wyld, Phys Rev **106** and Nucl Phys **4**, 1957)

$$\frac{d^5W}{dE_e d\Omega_e d\Omega_{\nu_e}} = \overbrace{\frac{G_F^2 |\mathbf{V}_{ud}|^2}{(2\pi)^5} p_e E_e (A_o - E_e)^2}^{\text{basic decay rate}} \xi \left(1 + \overbrace{\mathbf{a}_{\beta\nu} \frac{\vec{p}_e \cdot \vec{p}_{\nu_e}}{E_e E_{\nu_e}}}^{\beta-\nu \text{ correlation}} + \overbrace{\mathbf{b} \frac{\Gamma m_e}{E_e}}^{\text{Fierz term}} \right)$$
$$a_{\beta\nu} = \frac{|\mathbf{C}_V|^2 + |\mathbf{C}'_V|^2 - |\mathbf{C}_S|^2 - |\mathbf{C}'_S|^2}{|\mathbf{C}_V|^2 + |\mathbf{C}'_V|^2 + |\mathbf{C}_S|^2 + |\mathbf{C}'_S|^2} = 1??$$

The β - ν correlation parameter is quadratic in the couplings...not as sensitive as the Fierz parameter, which is linear:

$$b = \frac{-2\Re e(\mathbf{C}_S^* \mathbf{C}_V + \mathbf{C}'_S^* \mathbf{C}'_V)}{|\mathbf{C}_V|^2 + |\mathbf{C}'_V|^2 + |\mathbf{C}_S|^2 + |\mathbf{C}'_S|^2} = 0??$$

(see González-Alonso, Naviliat-Čunčić and Severijns, Prog. Part. Nucl Phys **104**, 165 (2019))

β decay and fundamental physics

- Expand to the often-quoted angular distribution of the decay
(Jackson, Treiman and Wyld, Phys Rev **106** and Nucl Phys **4**, 1957)

$$\frac{d^5W}{dE_e d\Omega_e d\Omega_{\nu_e}} = \overbrace{\frac{G_F^2 |\mathbf{V}_{ud}|^2}{(2\pi)^5} p_e E_e (A_0 - E_e)^2}^{\text{basic decay rate}} \left(\overbrace{\nu \frac{\vec{p}_e \cdot \vec{p}_{\nu_e}}{E_e E_{\nu_e}} + b \frac{\Gamma m_e}{E_e}}^{\beta-\nu \text{ correlation}} + \overbrace{\text{Fierz term}} \right) = \frac{|C_V|^2 + |C'_V|^2 - |C_S|^2 - |C'_S|^2}{|C_V|^2 + |C'_V|^2 + |C_S|^2 + |C'_S|^2} = 1??$$

Point is β decay depends on the current mediating the weak interaction
⇒ sensitive to new physics ⇔

Goal must be < 0.1% precision to complement other searches (LHC)

in the couplings...not linear:

$$b = \frac{-2\Re e(C_S^* C_V + C_S'^* C_V')}{|C_V|^2 + |C'_V|^2 + |C_S|^2 + |C'_S|^2} = 0??$$

(see González-Alonso, Naviliat-Čunčić and Severijns, Prog. Part. Nucl Phys **104**, 165 (2019))

Difficulty with MOTs: not all atoms can be trapped

**THE PERIODIC TABLE
OF THE ELEMENTS**

The Periodic Table of Elements is a tabular arrangement of chemical elements. It consists of 18 groups (vertical columns) and 7 periods (horizontal rows). The groups are color-coded: 1A (blue), 2A (orange), 3A (light green), 4A (yellow-green), 5A (light blue), 6A (medium blue), 7A (purple), and 8A (dark purple). The first two groups (1A and 2A) are also known as the alkali metals and alkaline earth metals respectively. The last group (8A) is also known as the noble gases. The table includes element symbols, atomic numbers, and atomic masses. The Lanthanide and Actinide series are shown as separate blocks below the main table.

THE PERIODIC TABLE OF THE ELEMENTS trappable

Difficulty with MOTs: not all atoms can be trapped

The TRIUMF Neutral Atom Trap

Isobaric analogue decay of ^{37}K

- Beautiful nucleus to test the standard model:

- ★ Alkali atom \Rightarrow “easy” to trap with a MOT and polarize with optical pumping
- ★ Isobaric analogue decay
 \Rightarrow theoretically clean; recoil-order corrections under control

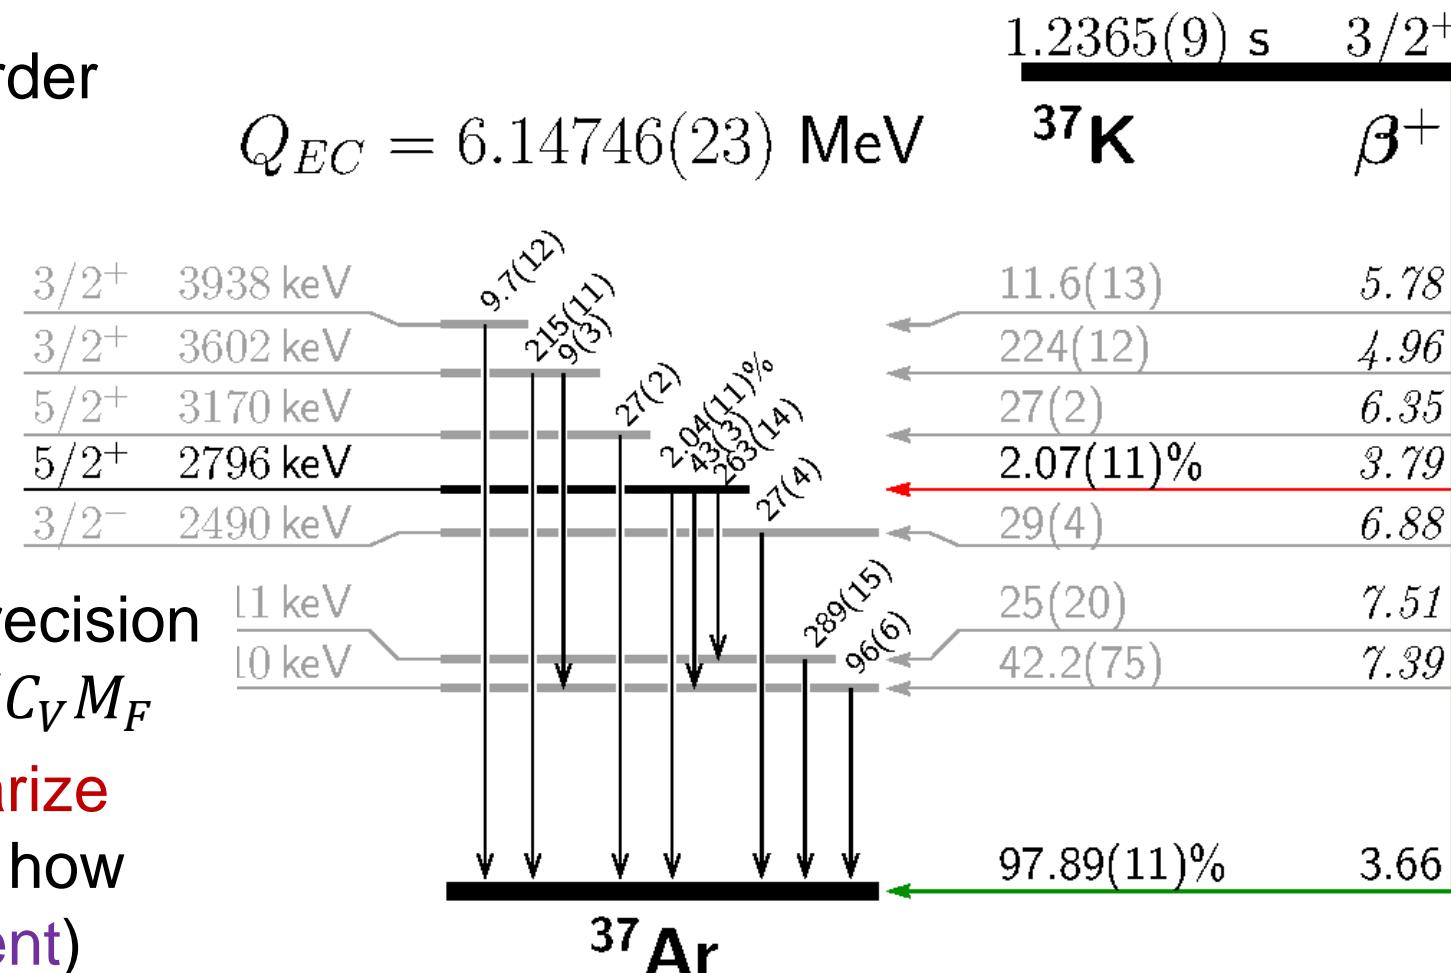

- ★ Lifetime, Q-value and branches (i.e. the *Ft value*) well known

- ★ Strong branch to the g.s.

- But there are challenges...

- ★ Can't calculate $C_A M_{GT}$ to high precision
 \Rightarrow need to measure $\rho \equiv C_A M_{GT} / C_V M_F$

- ★ Nuclear spin 3/2 \Rightarrow need to polarize the atoms, and especially know how polarized they are (also alignment)

The Ft is measured well enough (for now)

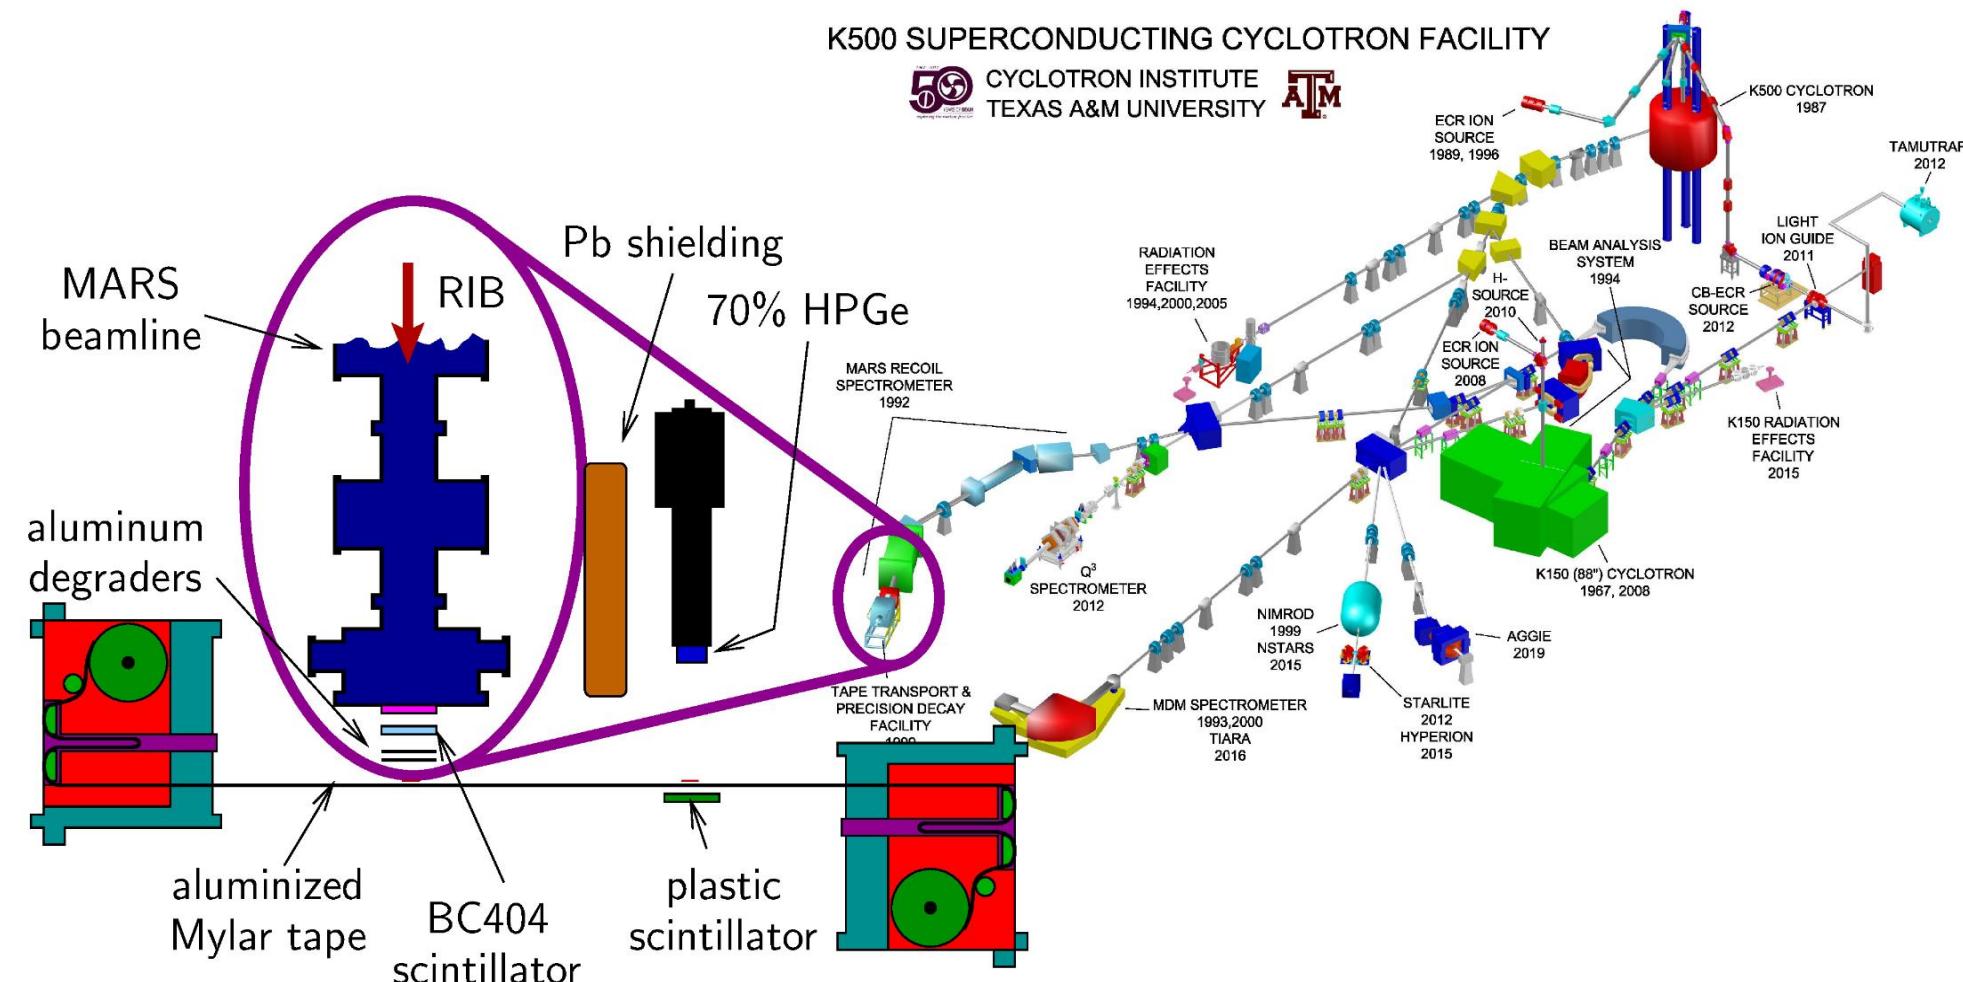

$$dW = dW_0 \left[1 + a \frac{\vec{p}_\beta \cdot \vec{p}_\nu}{E_\beta E_\nu} + b \frac{\Gamma m_e}{E_\beta} + \frac{\langle \vec{I} \rangle}{I} \cdot \left(\textcolor{blue}{A}_\beta \frac{\vec{p}_\beta}{E_\beta} + B_\nu \frac{\vec{p}_\nu}{E_\nu} + D \frac{\vec{p}_\beta \times \vec{p}_\nu}{E_\beta E_\nu} \right) + \begin{matrix} \text{alignment} \\ \text{term} \end{matrix} \right]$$

Correlation	SM expectation
$\beta - \nu$ correlation	$a_{\beta\nu} = 0.6648(18)$
Fierz interference	$b = 0$ (sensitive to scalars & tensors)
β asymmetry	$A_\beta = -0.5706(7)$
ν asymmetry	$B_\nu = -0.7702(18)$
Time-violating correlation	$D = 0$ (sensitive to imaginary couplings)

SM predictions currently limited by the >20-yr-old
97.89(11)% ground state branching ratio

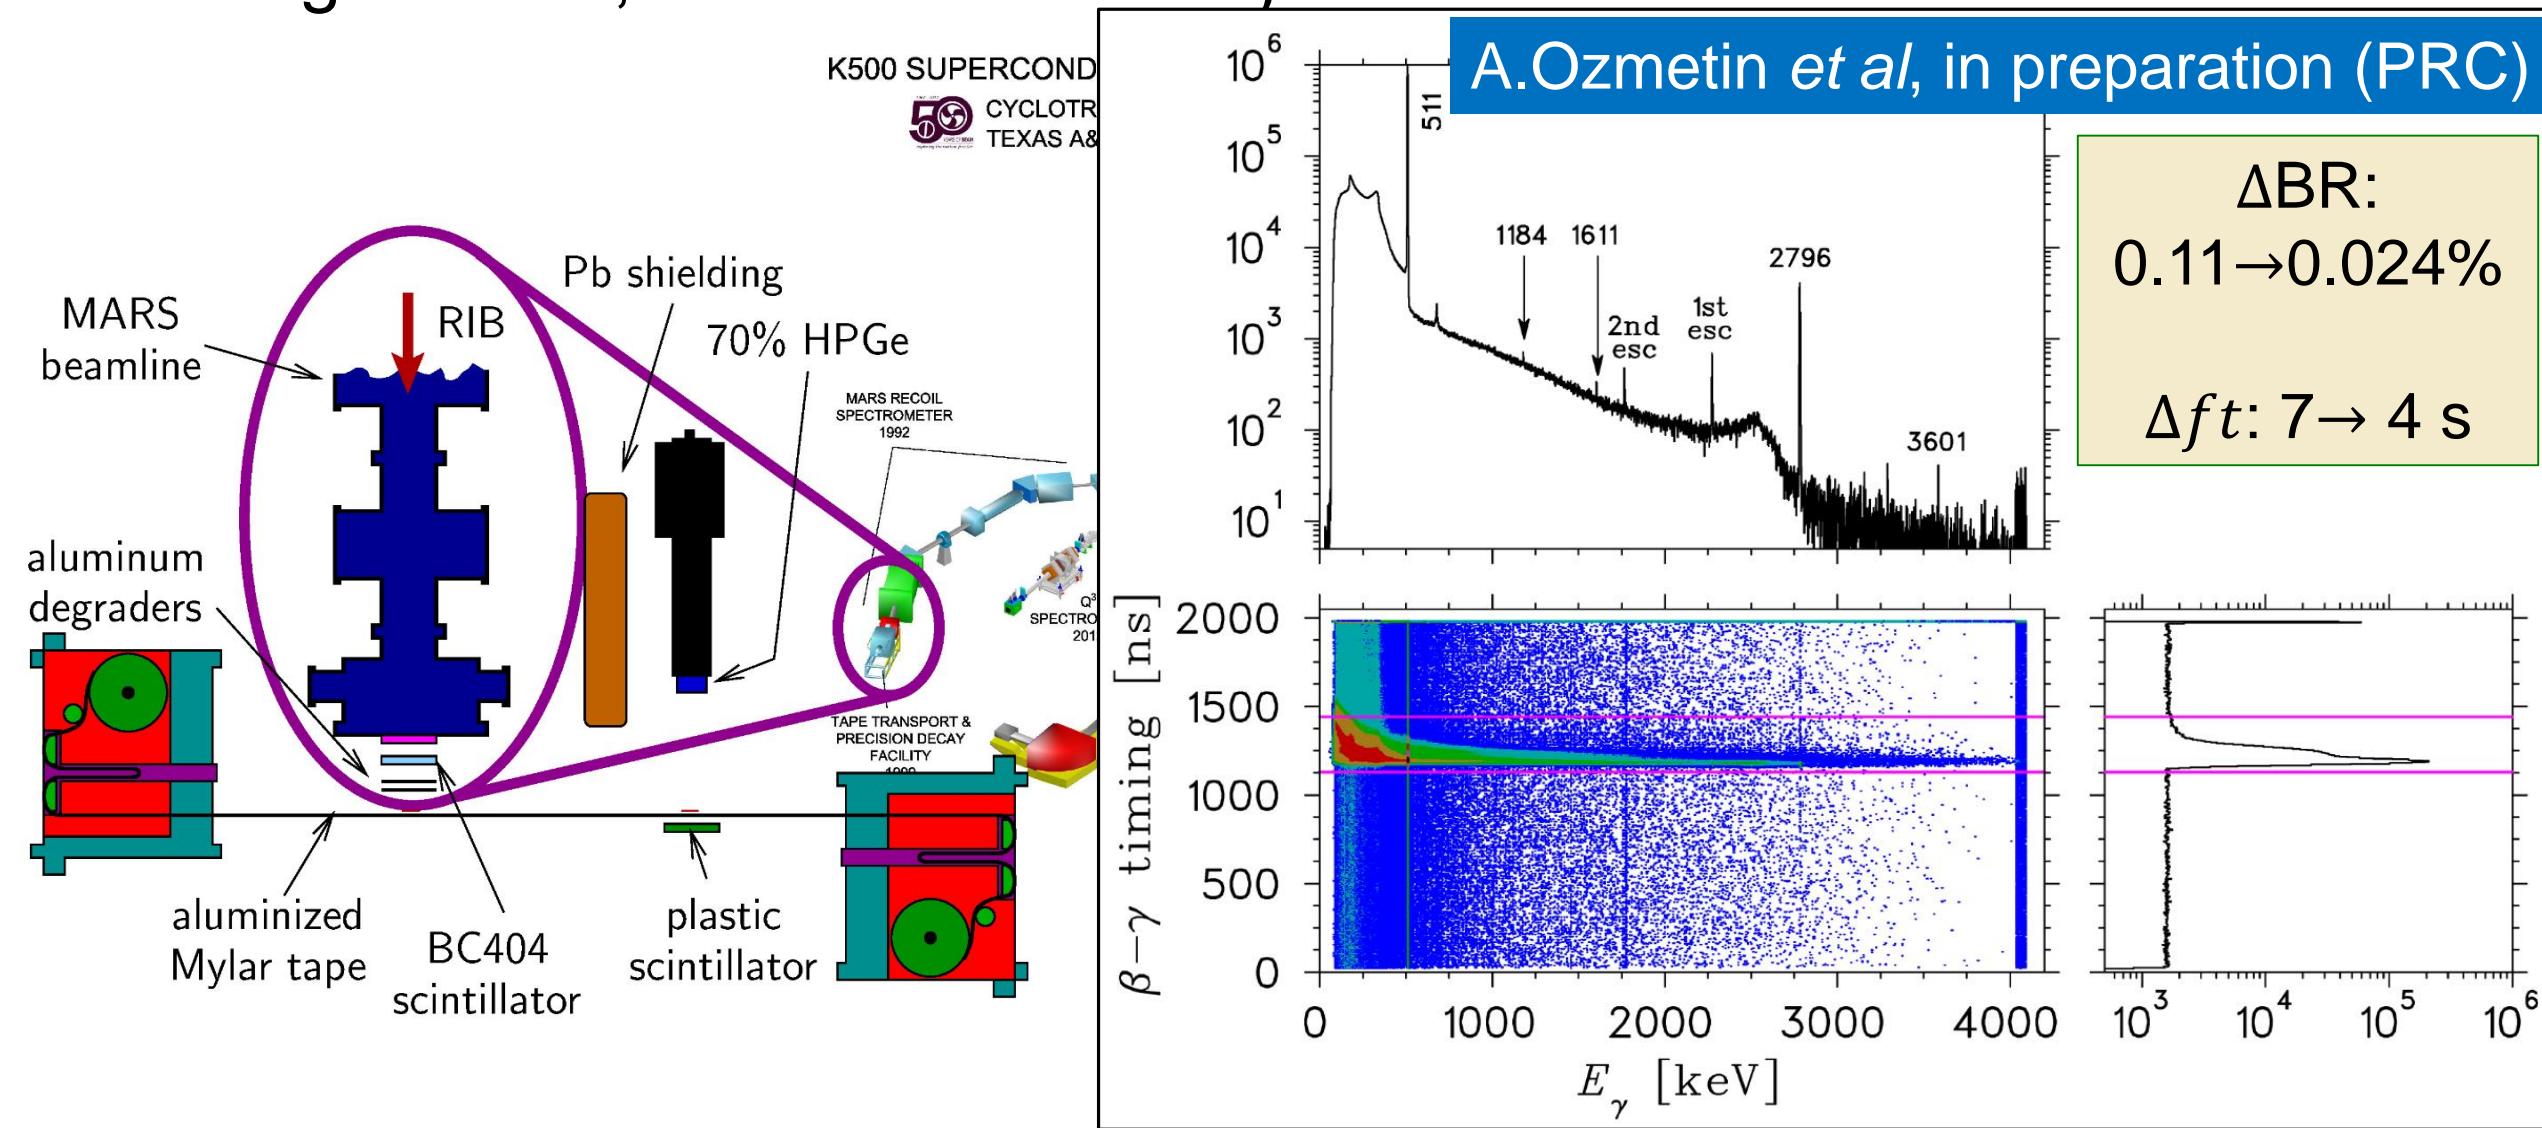

Improving the ft value at the Cyclotron Institute

- Looking forward, we don't want the ft value to limit a SM test

Improving the ft value at the Cyclotron Institute

- Looking forward, we don't want the ft value to limit a SM test

The F_ℓ is measured well enough

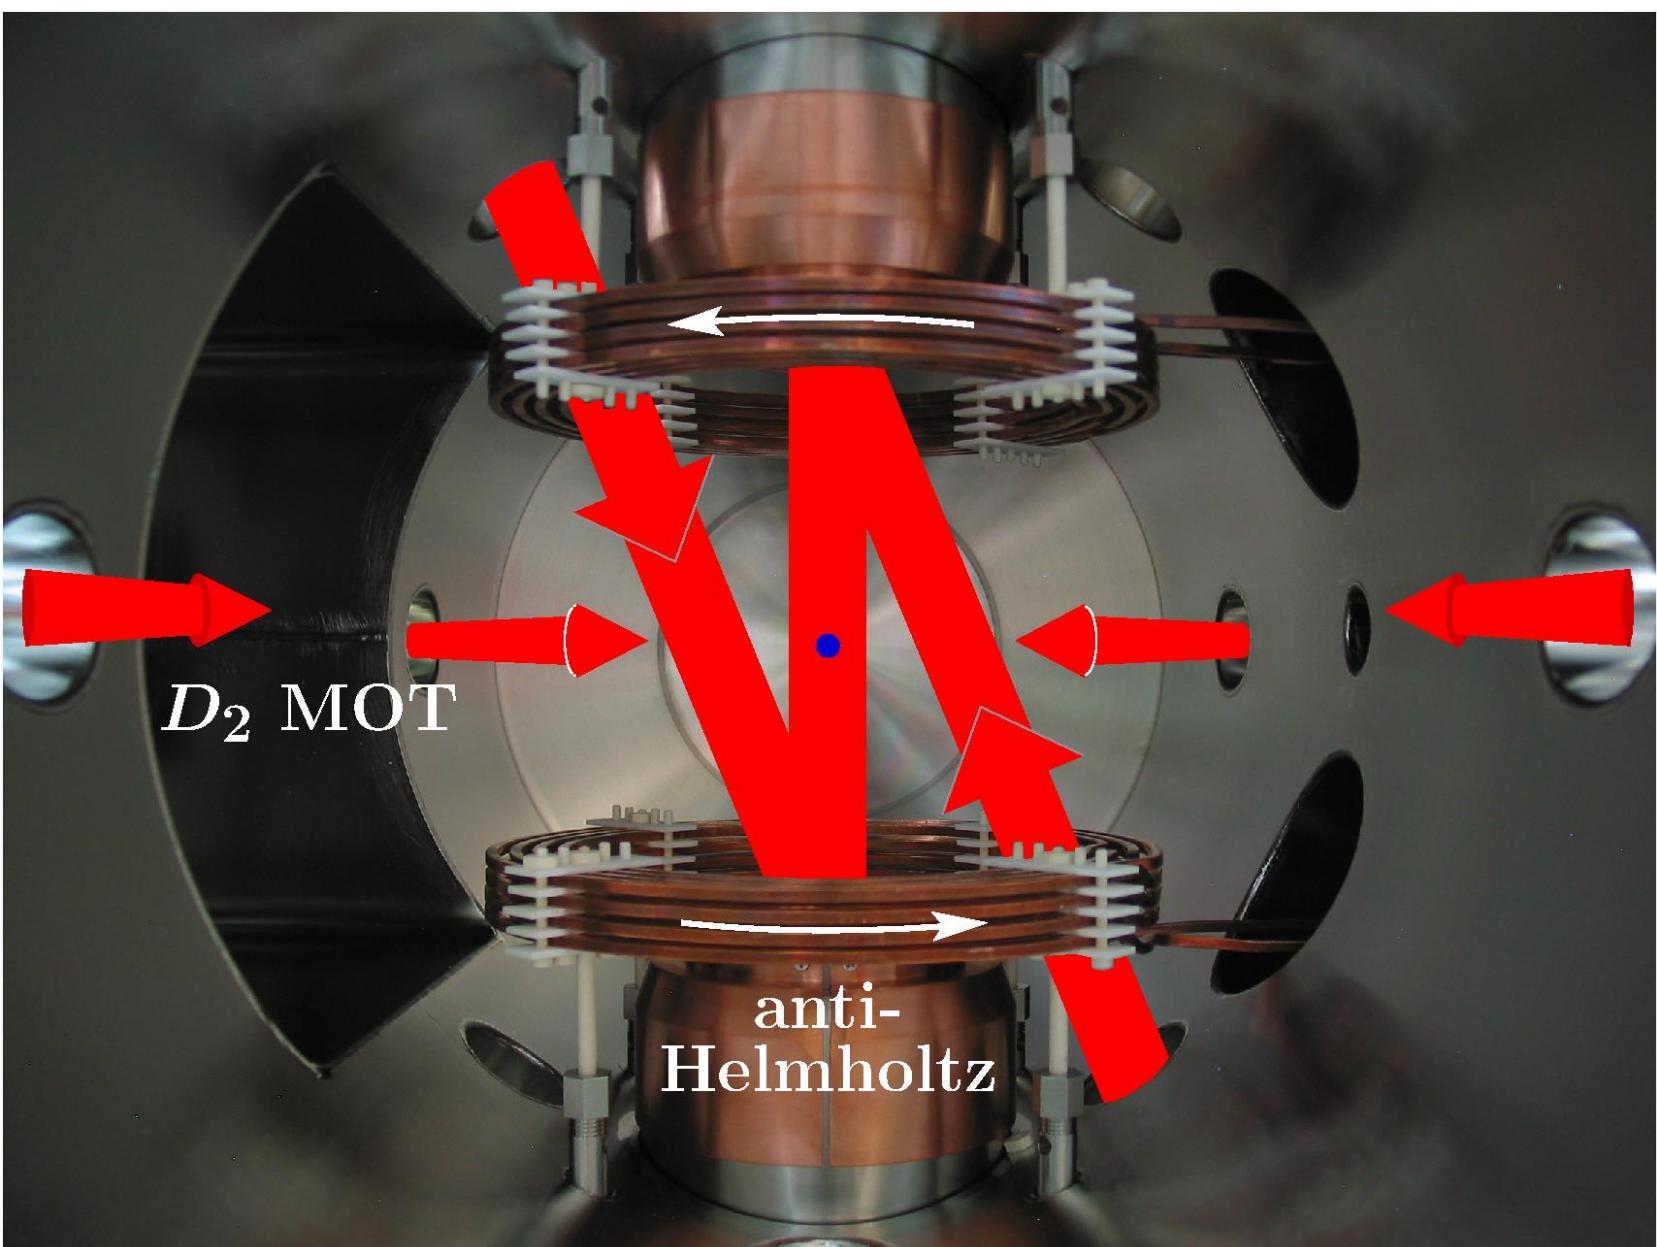

$$dW = dW_0 \left[1 + a \frac{\vec{p}_\beta \cdot \vec{p}_\nu}{E_\beta E_\nu} + b \frac{\Gamma m_e}{E_\beta} + \frac{\langle \vec{I} \rangle}{I} \cdot \left(A_\beta \frac{\vec{p}_\beta}{E_\beta} + B_\nu \frac{\vec{p}_\nu}{E_\nu} + D \frac{\vec{p}_\beta \times \vec{p}_\nu}{E_\beta E_\nu} \right) + \text{alignment term} \right]$$

Correlation	SM expectation
$\beta - \nu$ correlation	$a_{\beta\nu} = 0.6648(18) \rightarrow 0.6668(11)$
Fierz interference	$b = 0$ (sensitive to scalars & tensors)
β asymmetry	$A_\beta = -0.5706(7) \rightarrow -0.5708(4)$
ν asymmetry	$B_\nu = -0.7702(18) \rightarrow -0.7707(11)$
Time-violating correlation	$D = 0$ (sensitive to imaginary couplings)

→ A precision measurement of A_β will not be limited by uncertainties in the SM predictions ←

Outline of TRINAT's β asym & polarization measurements

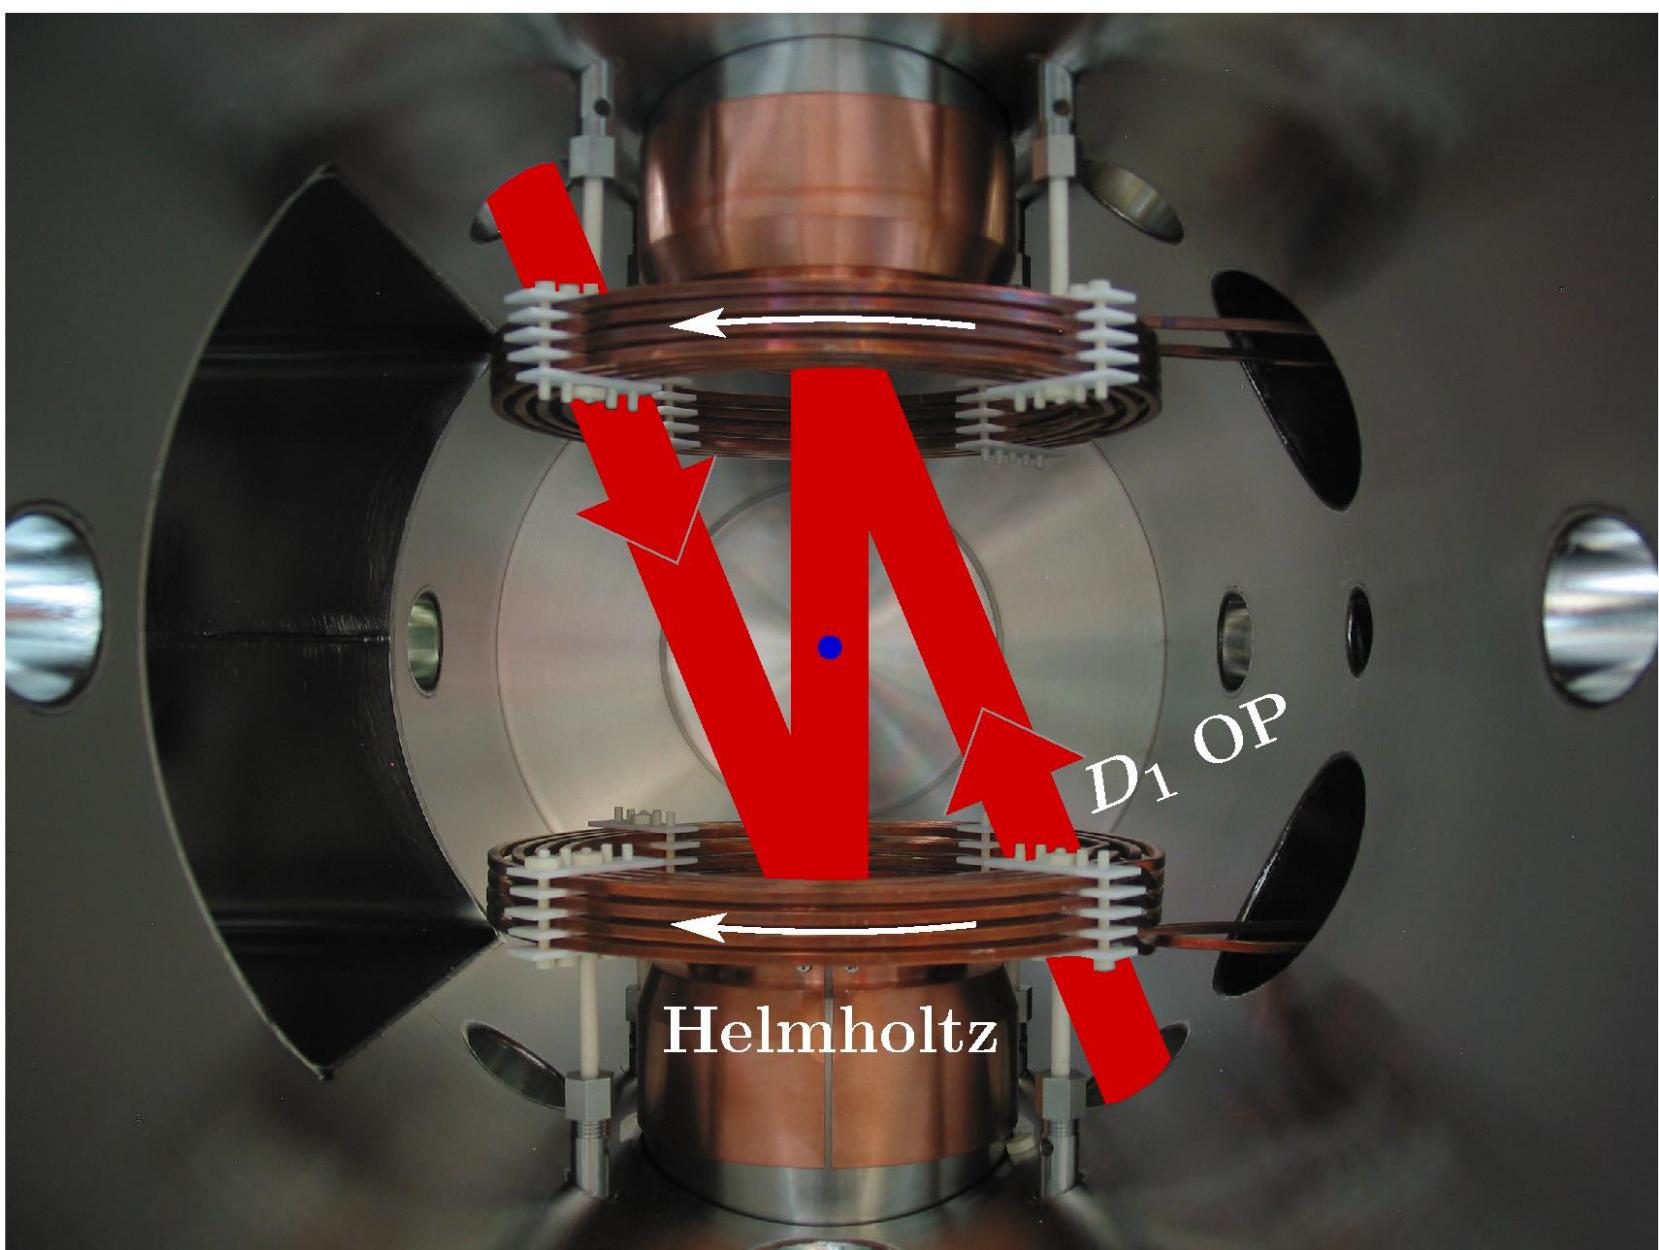

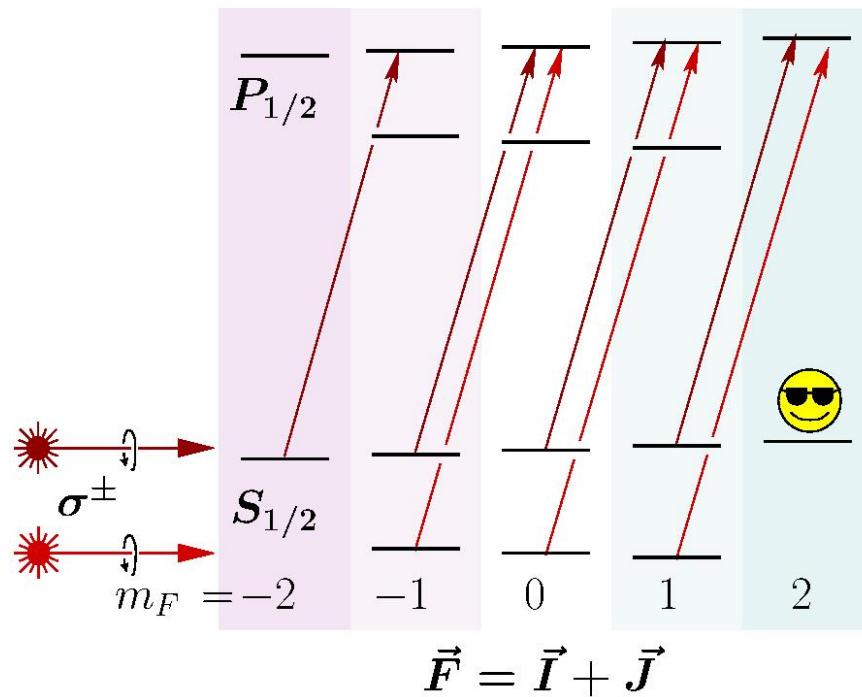

- MOTs provide a source that is:
 - Cold (~ 1 mK)
 - Localized (~ 1 mm 3)
 - In an open, backing-free geometry
- Allows us to detect \vec{p}_β and \vec{p}_{rec}
 \Rightarrow deduce \vec{p}_ν event-by-event

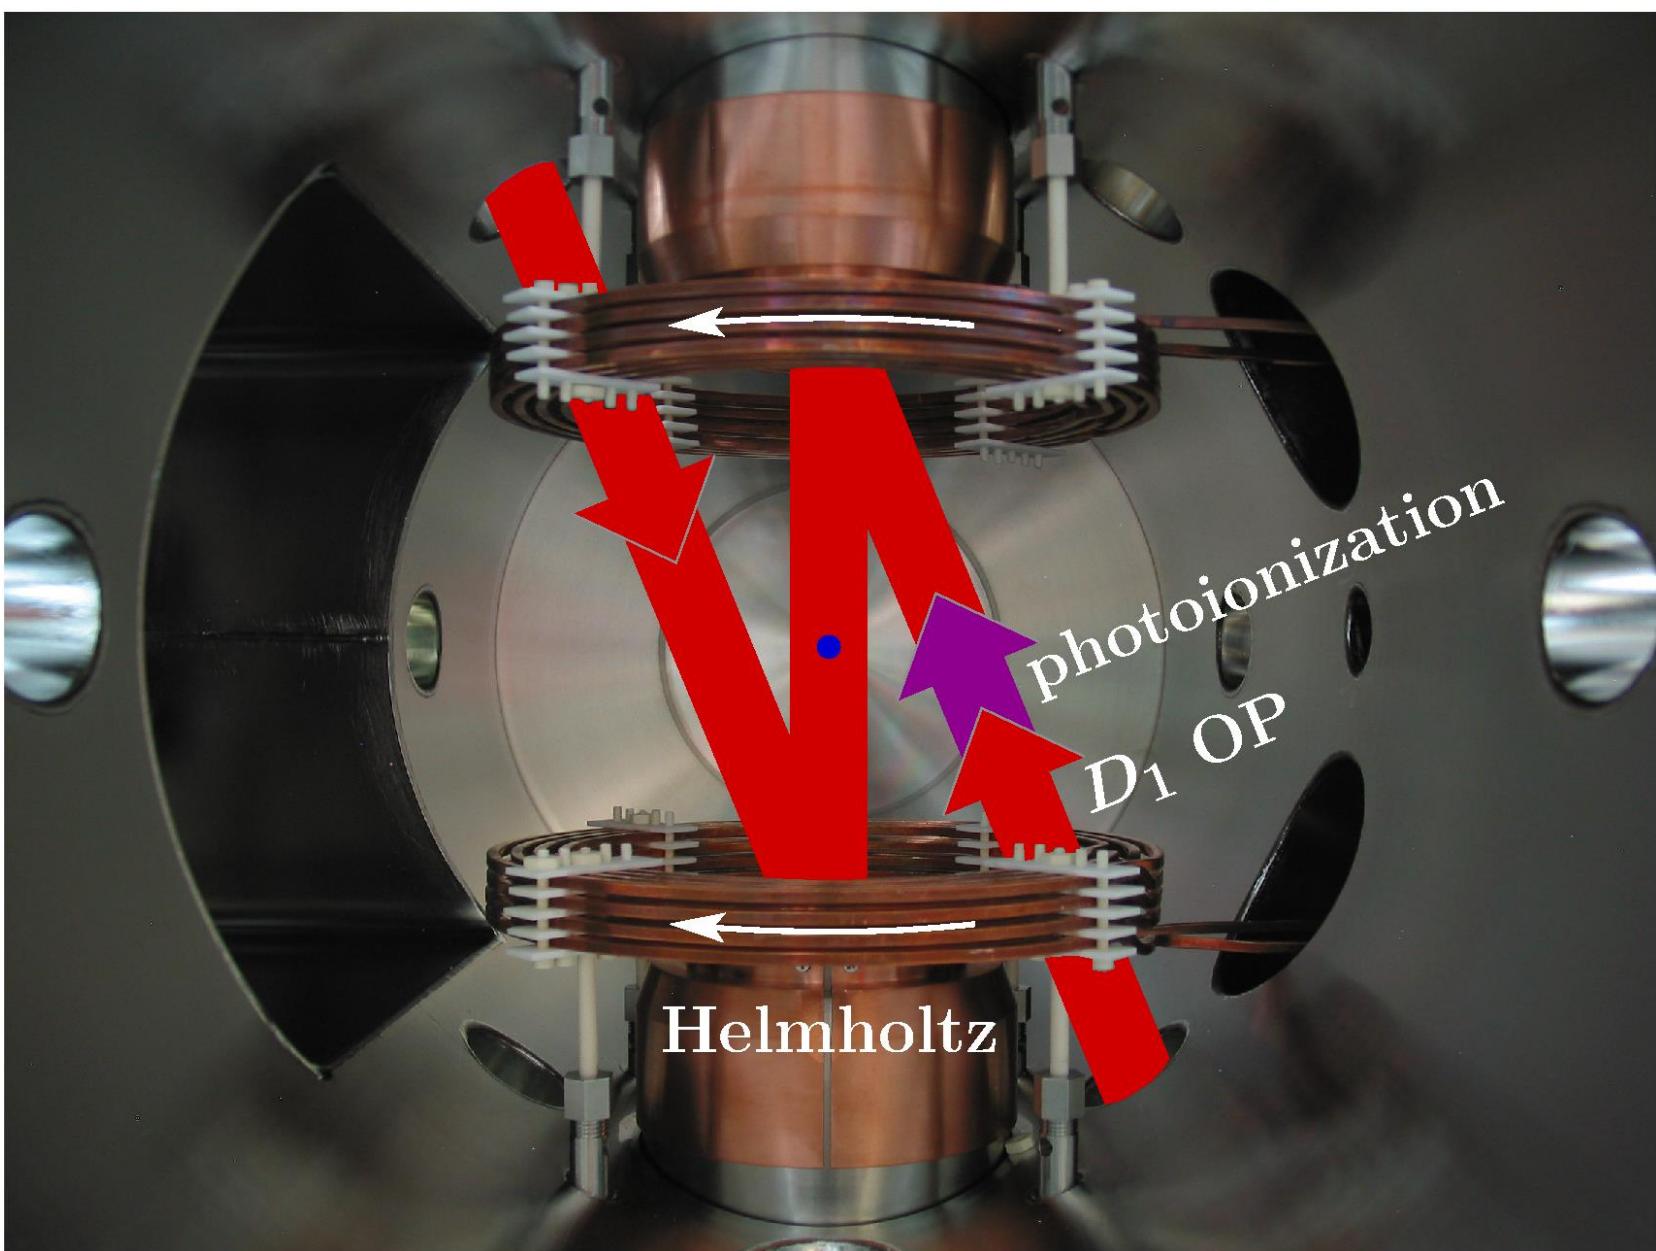

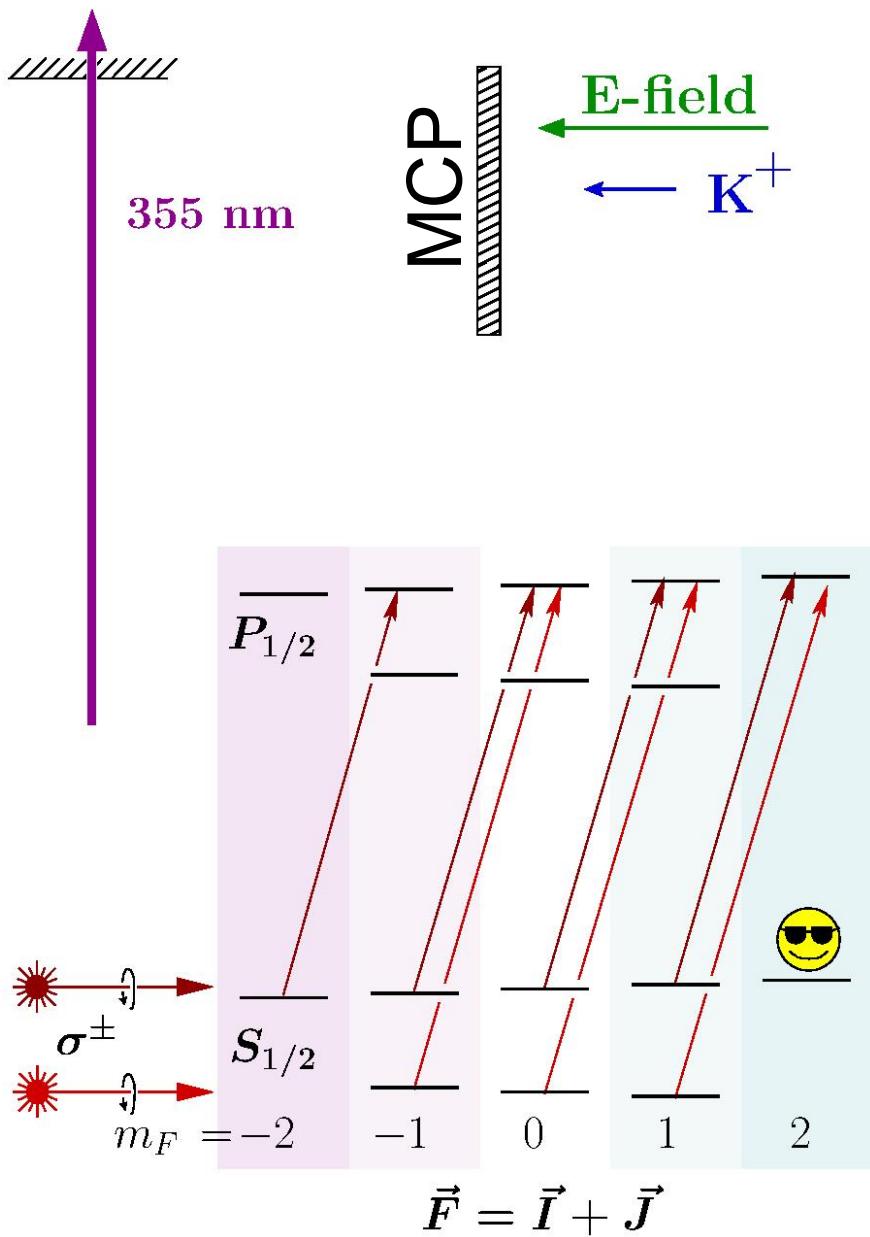

Outline of TRINAT's β asym & polarization measurements

- Optical pumping:

- Polarized light transfers angular momentum to the atom
- Nuclear and atomic spins are coupled
- Polarize as (cold) atoms expand

Outline of TRINAT's β asym & polarization

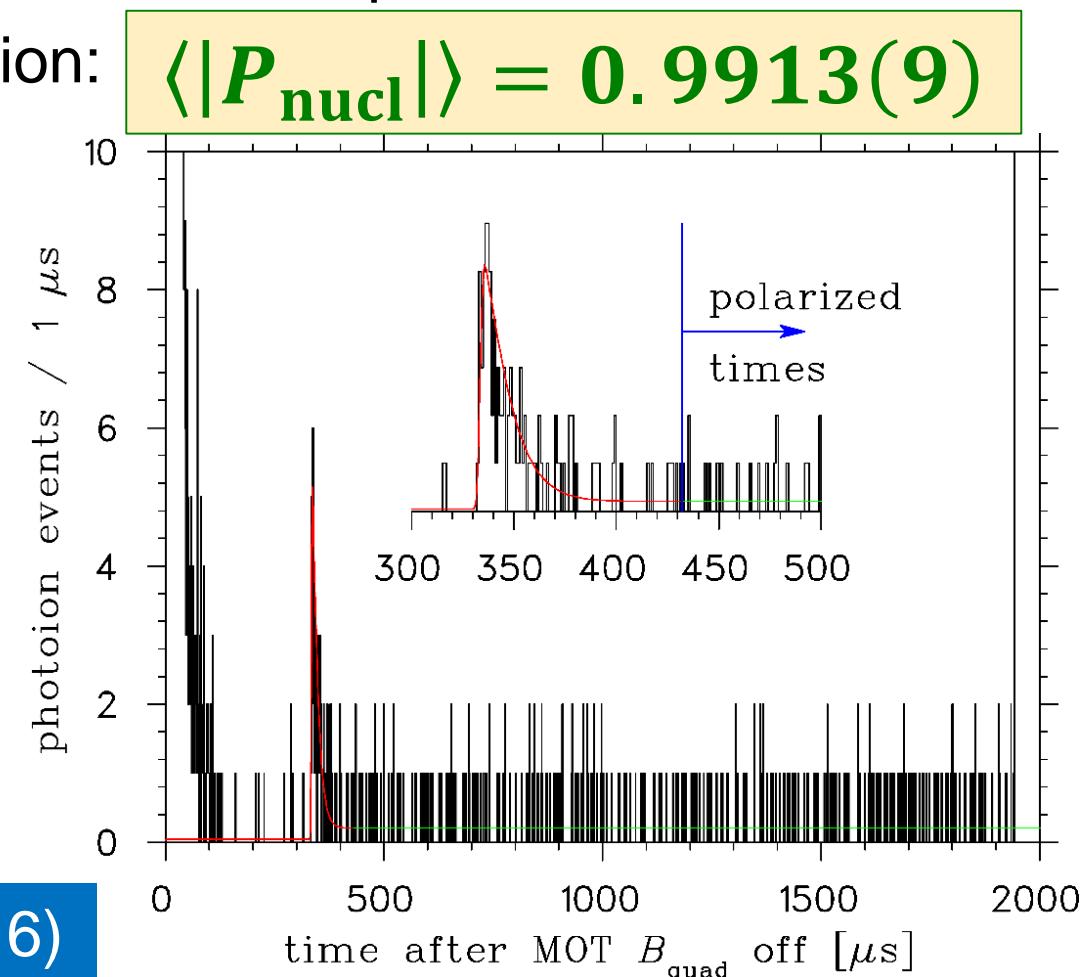

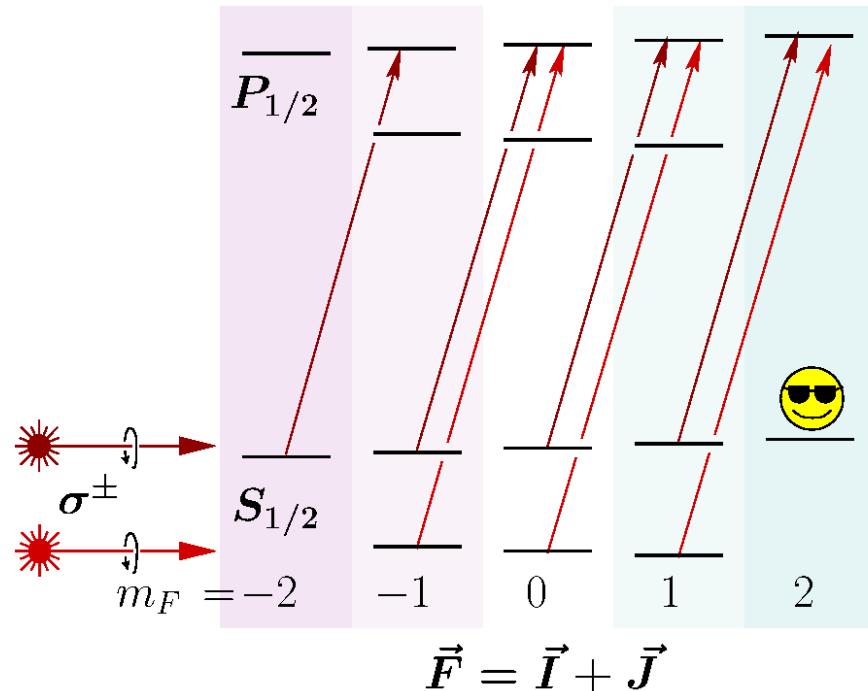

Optical pumping is fast and efficient!

- No time to go into details, but basically

- Measure the rate of photons (\Leftrightarrow fluorescence) as a function of time
- Model sublevel populations using the optical Bloch equations
- Determine the average nuclear polarization:

$$\langle |P_{\text{nucl}}| \rangle = 0.9913(9)$$

B.Fenker *et al*, New J. Phys. 18, 073028 (2016)

The β asymmetry measurement

E_β detectors:

Plastic scintillator

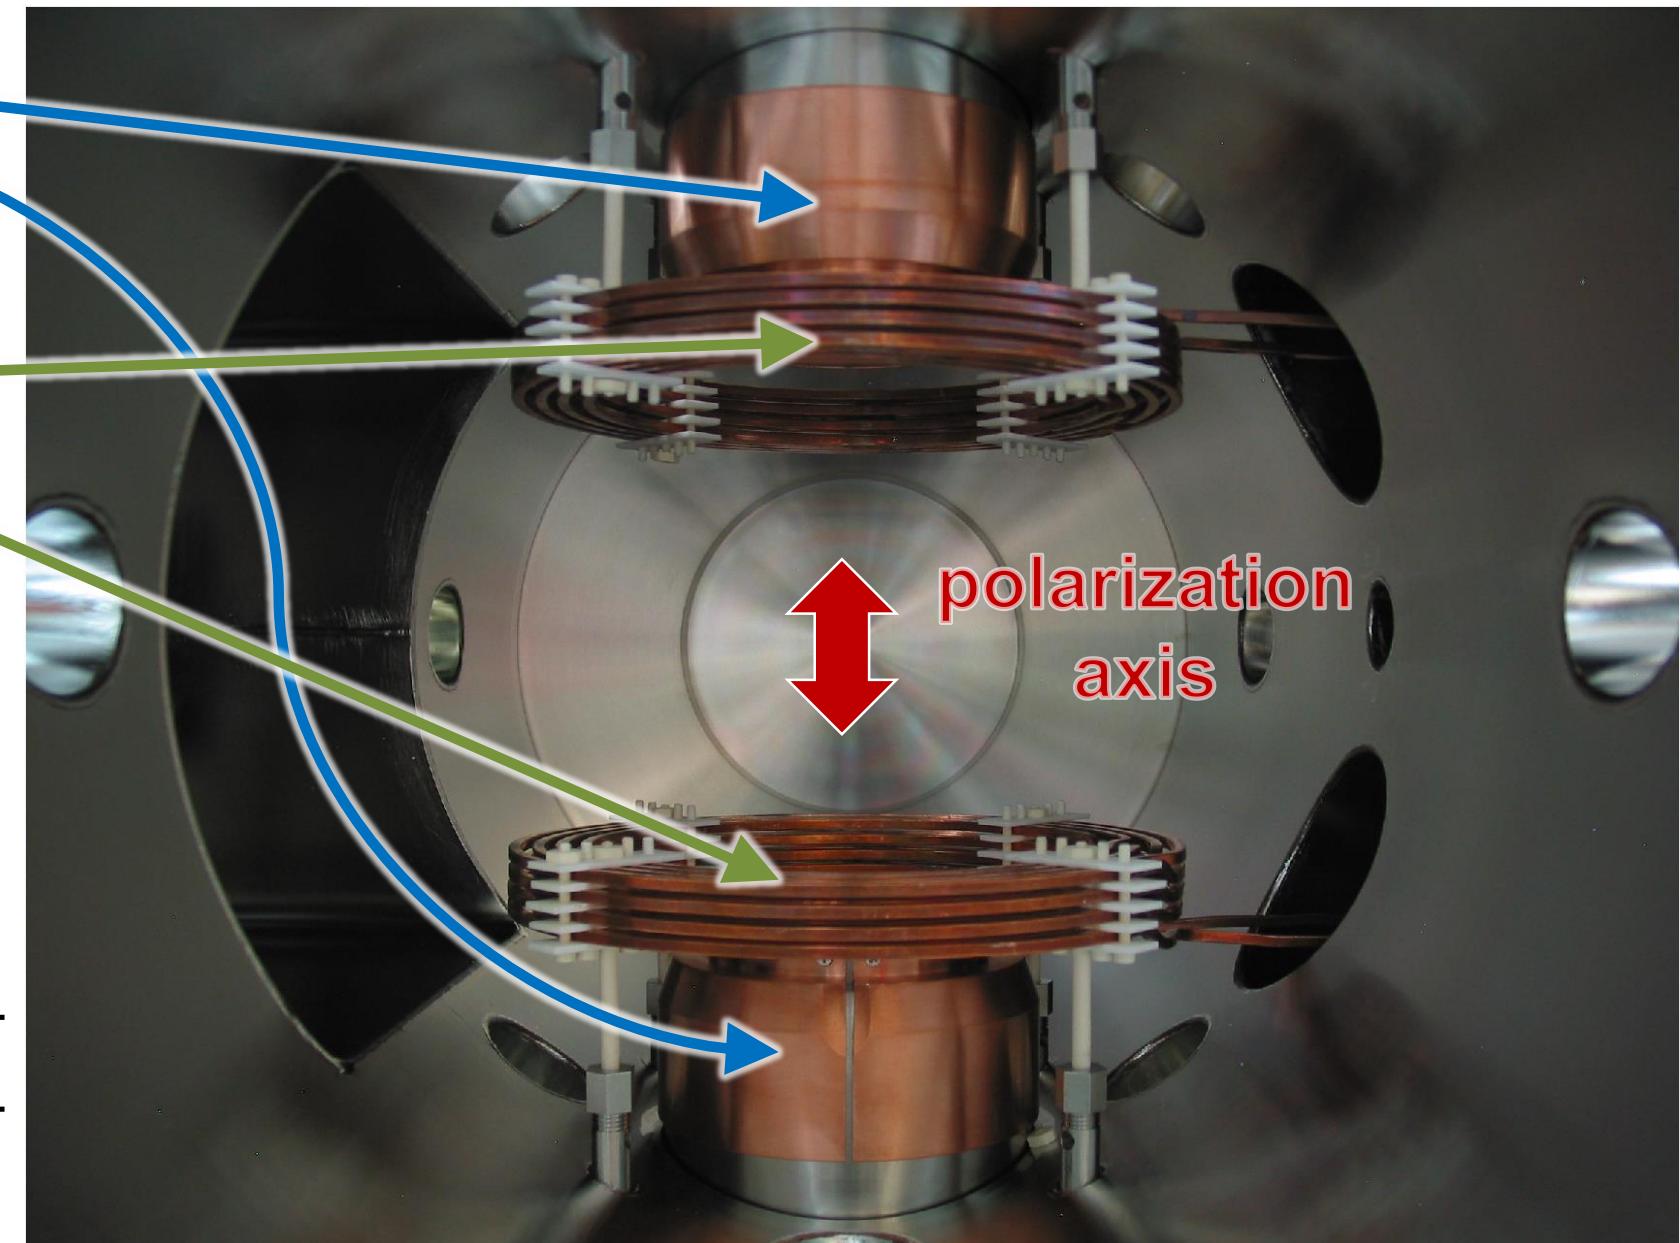

ΔE_β detectors:

Double-sided Si-strip

Use **all** information via
the super-ratio:

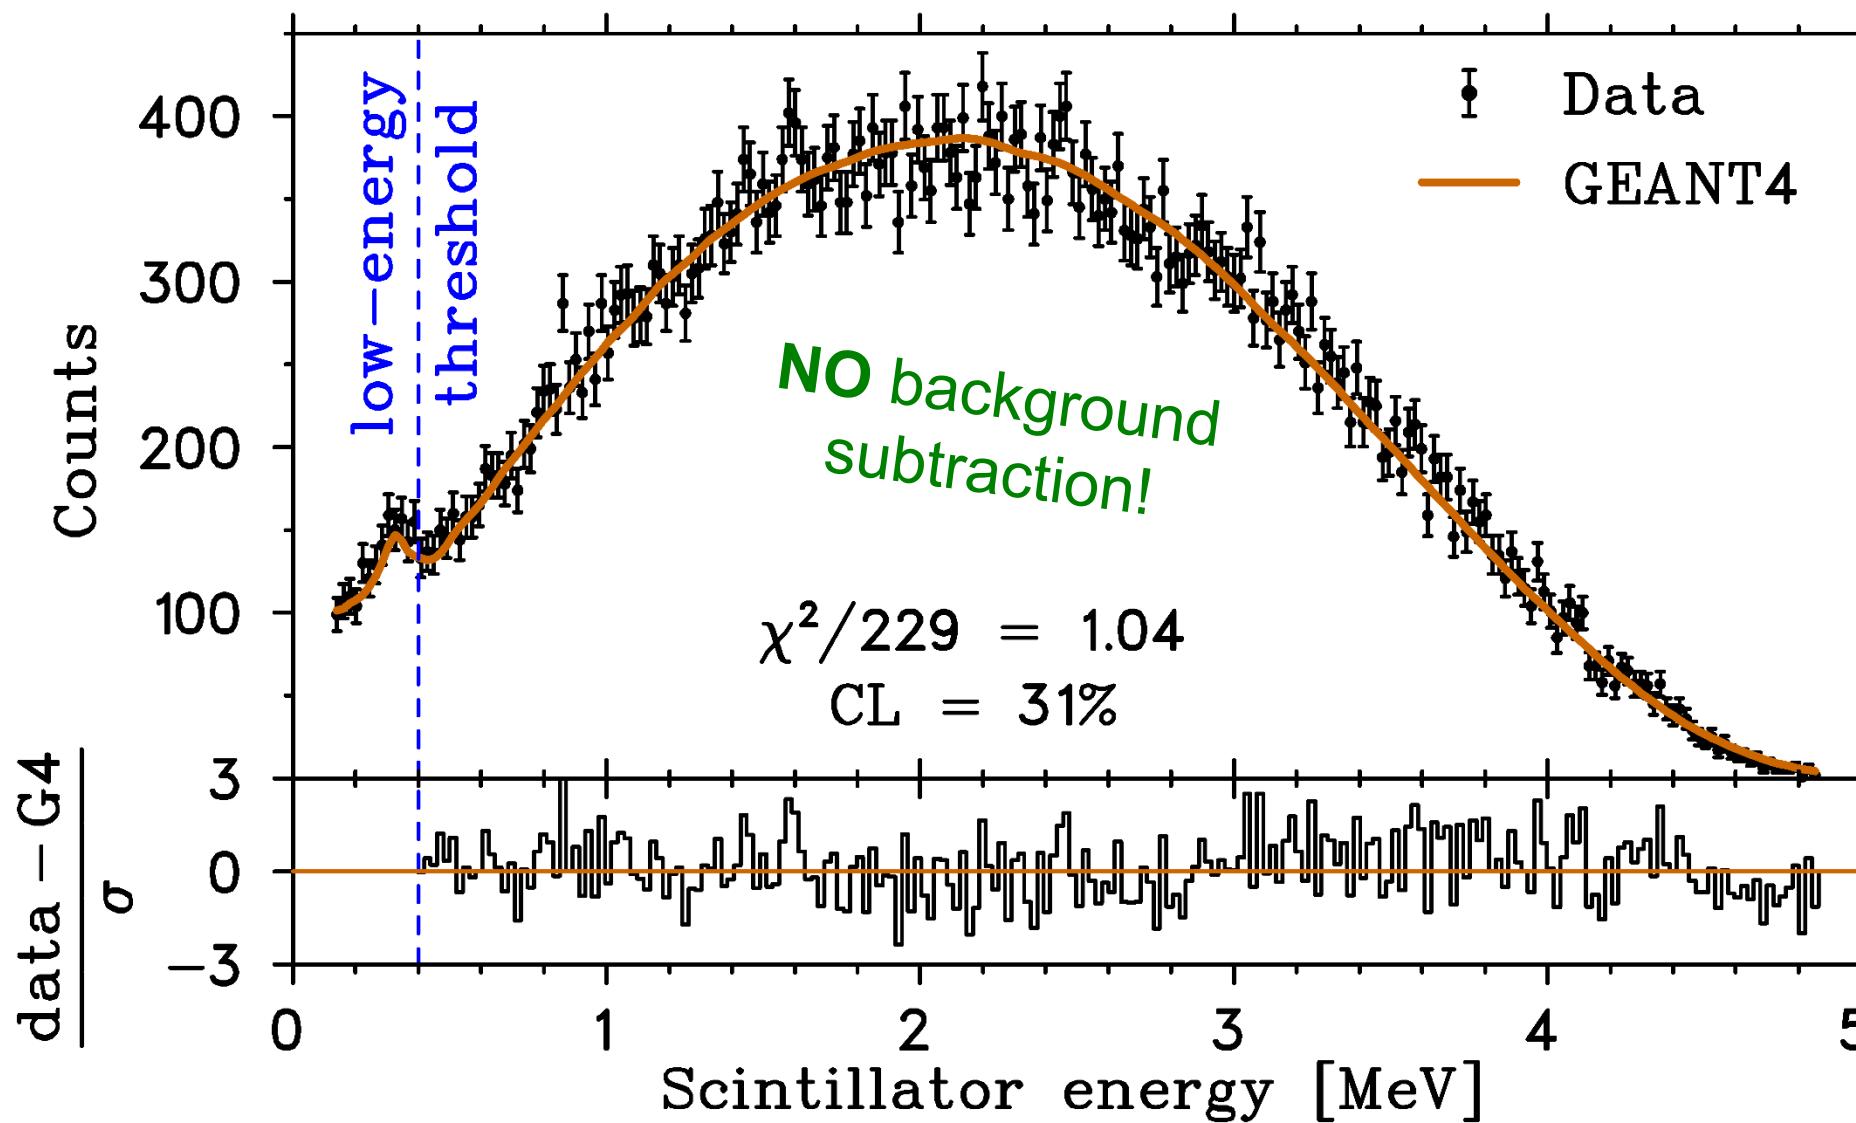

$$A_{\text{obs}}(E_e) = \frac{1 - S(E_e)}{1 + S(E_e)}$$

$$\text{with } S(E_e) = \sqrt{\frac{r_1^\uparrow(E_e) r_2^\downarrow(E_e)}{r_1^\downarrow(E_e) r_2^\uparrow(E_e)}}$$

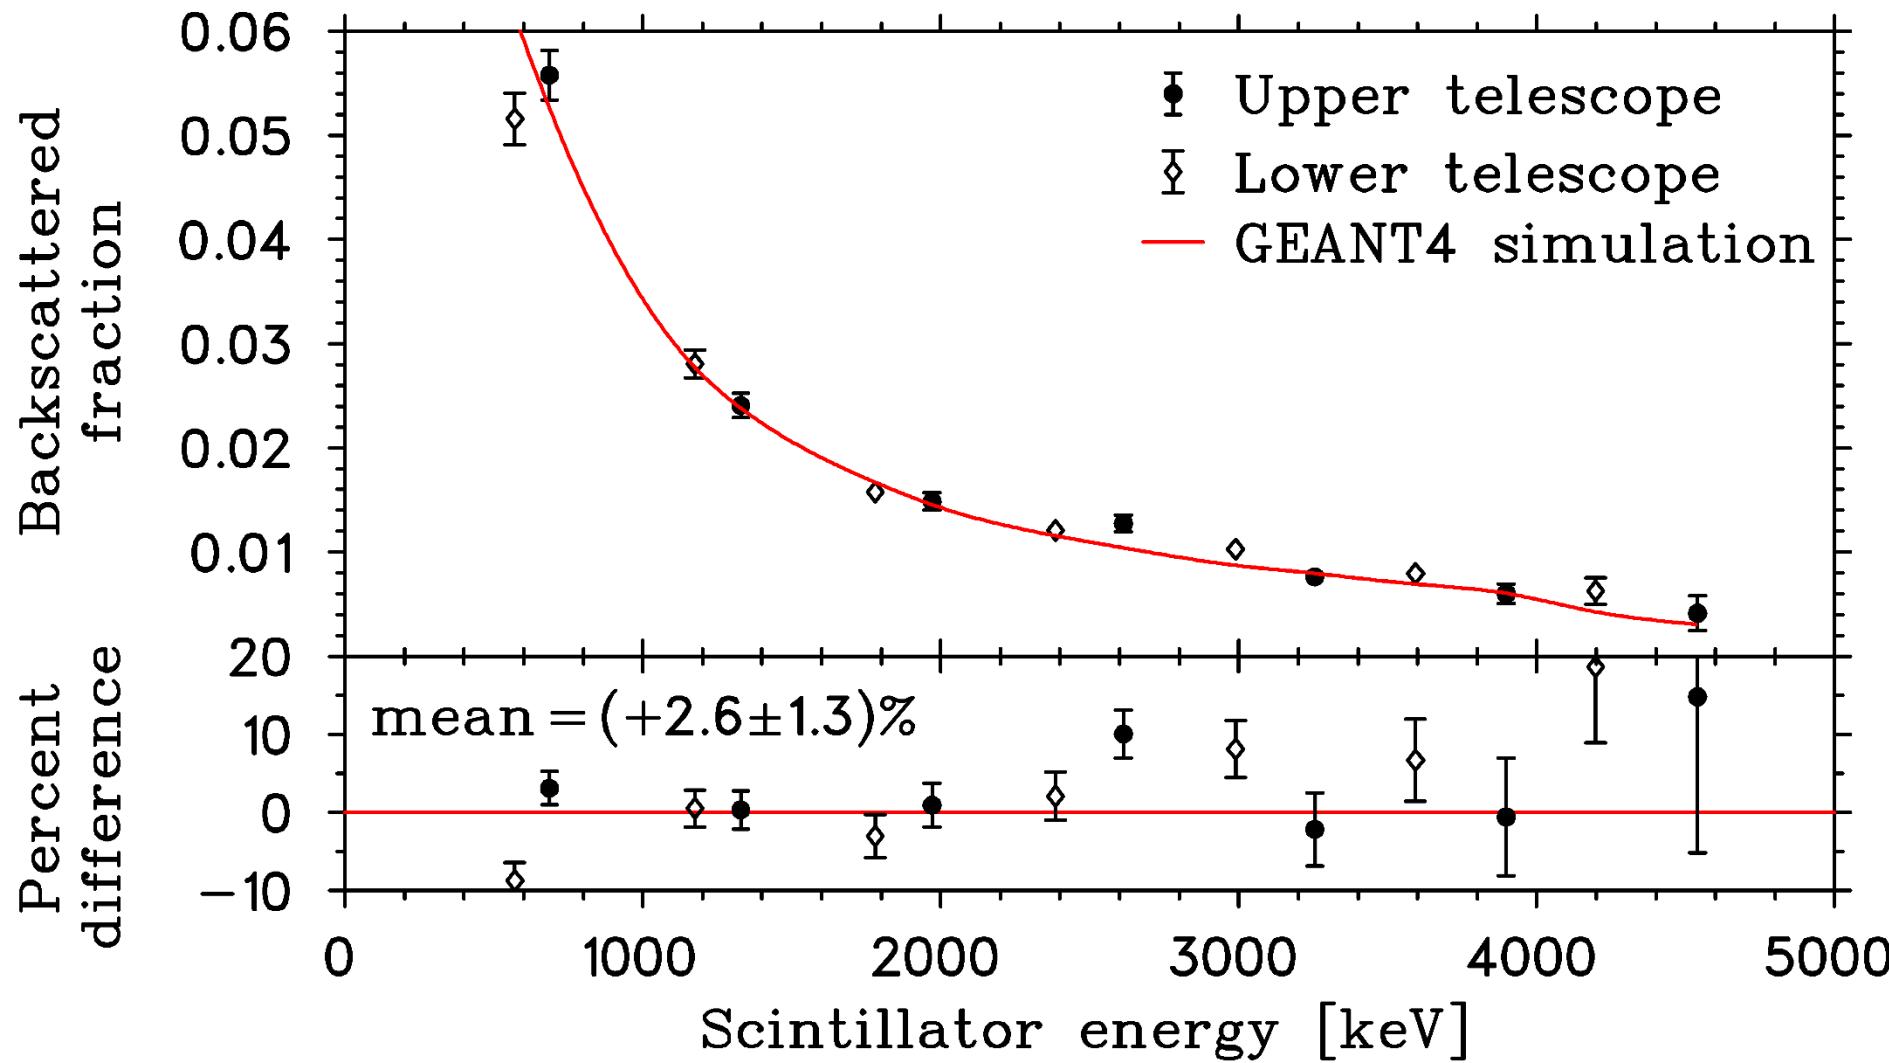

^{37}K β asymmetry measurement

- Energy spectrum – *great agreement* with GEANT4 simulations:

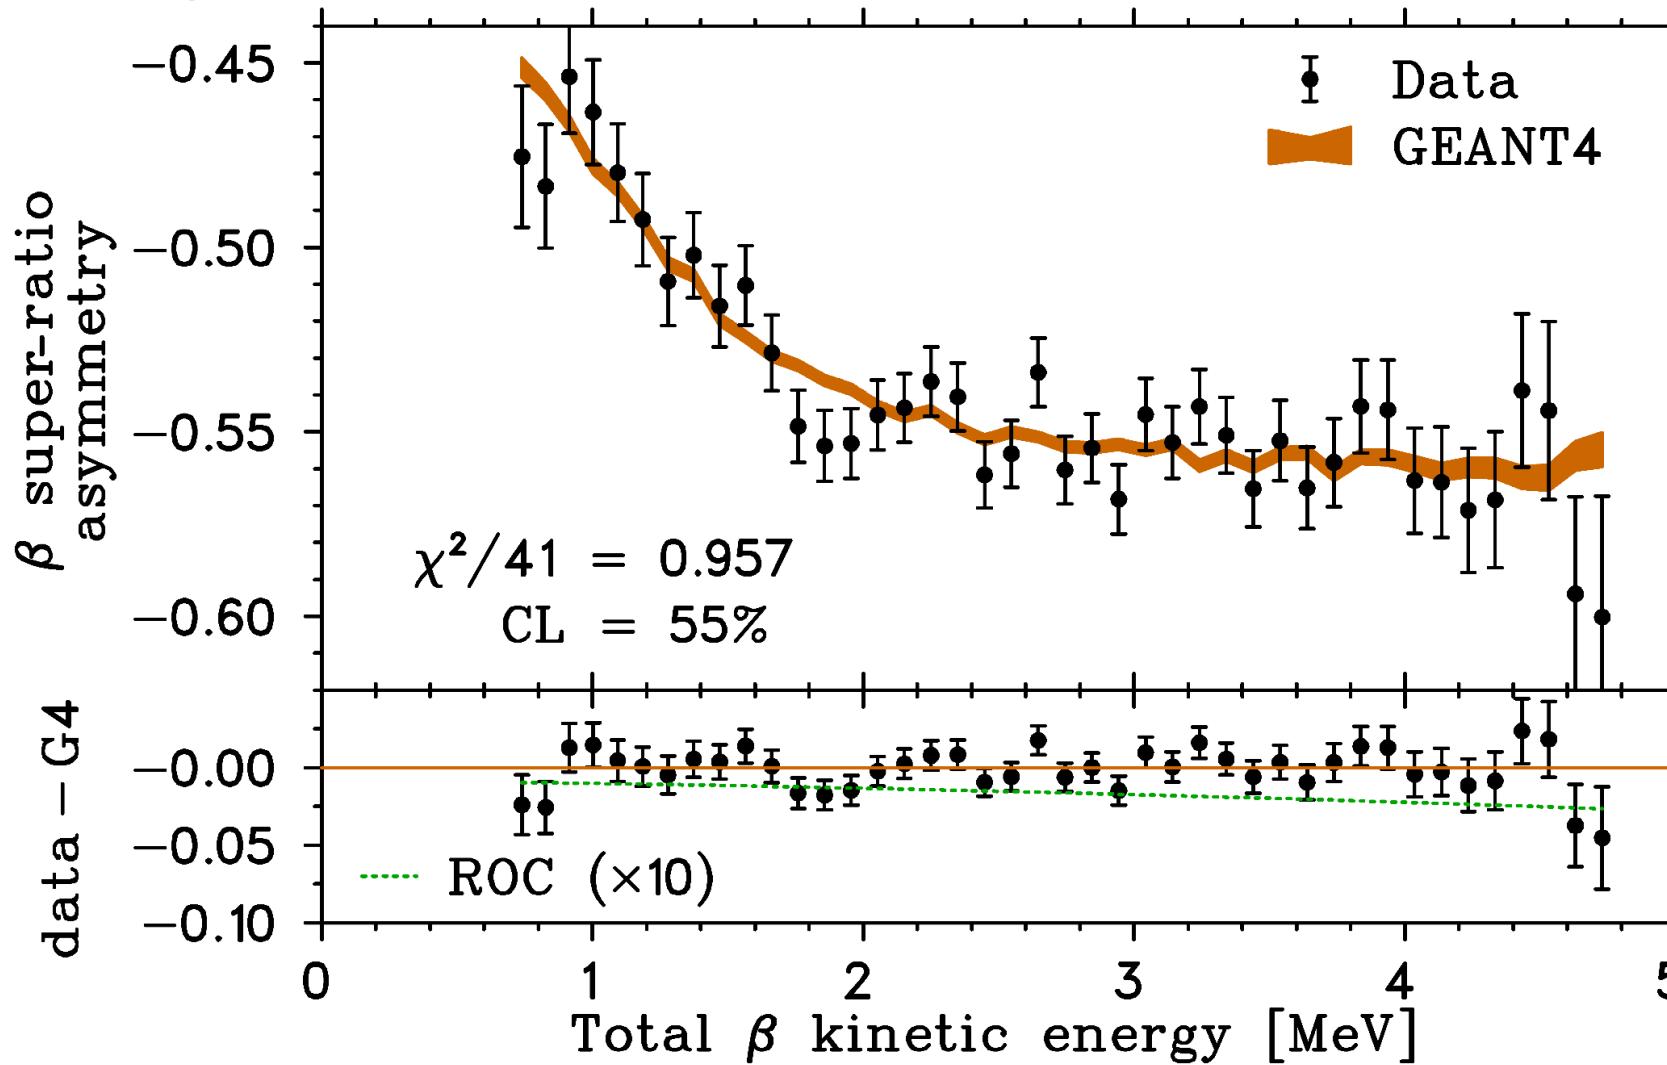

^{37}K β asymmetry measurement

- Energy spectrum – **great agreement** with GEANT4 simulations:
- Backscattering too!

^{37}K β asymmetry measurement

- Asymmetry as a function of β energy after unblinding
(again, **no background subtraction!**):

(Dominant) Error budget and A_β result

Source	Correction	Uncertainty, ΔA_β
Systematics		
Background	1.0014	8×10^{-4}
β scattering	1.0230	7×10^{-4}
Trap position		4×10^{-4}
Trap movement		5×10^{-4}
ΔE position cut		4×10^{-4}
Shake-off e^- TOF region		3×10^{-4}
TOTAL SYSTEMATICS		13×10^{-4}
STATISTICS		13×10^{-4}
POLARIZATION		5×10^{-4}
TOTAL UNCERTAINTY		19×10^{-4}

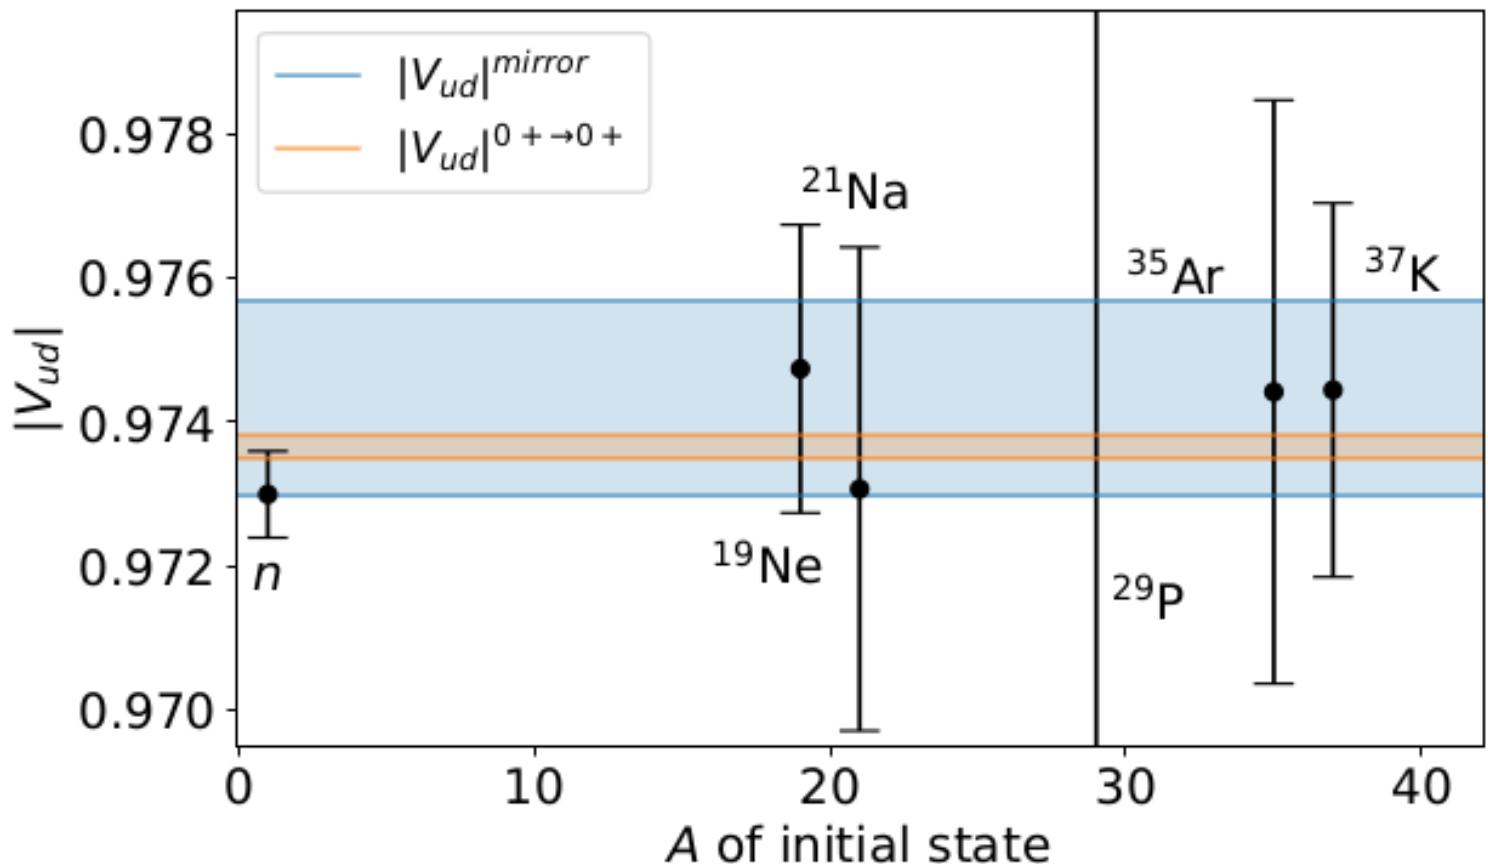

$$A_\beta^{\text{meas}} = -0.5707(19) \text{ cf } A_\beta^{\text{SM}} = -0.5706(7) \quad (\text{includes recoil-order corrections, } \Delta A_\beta \approx -0.0028 \frac{E_\beta}{E_0})$$

B.Fenker *et al*, PRL 120, 062502 (2018)

Interpretation and future prospects

- Comparison of V_{ud} from:

- Mirror nuclei (including ^{37}K)
- The neutron
- Pure Fermi decays

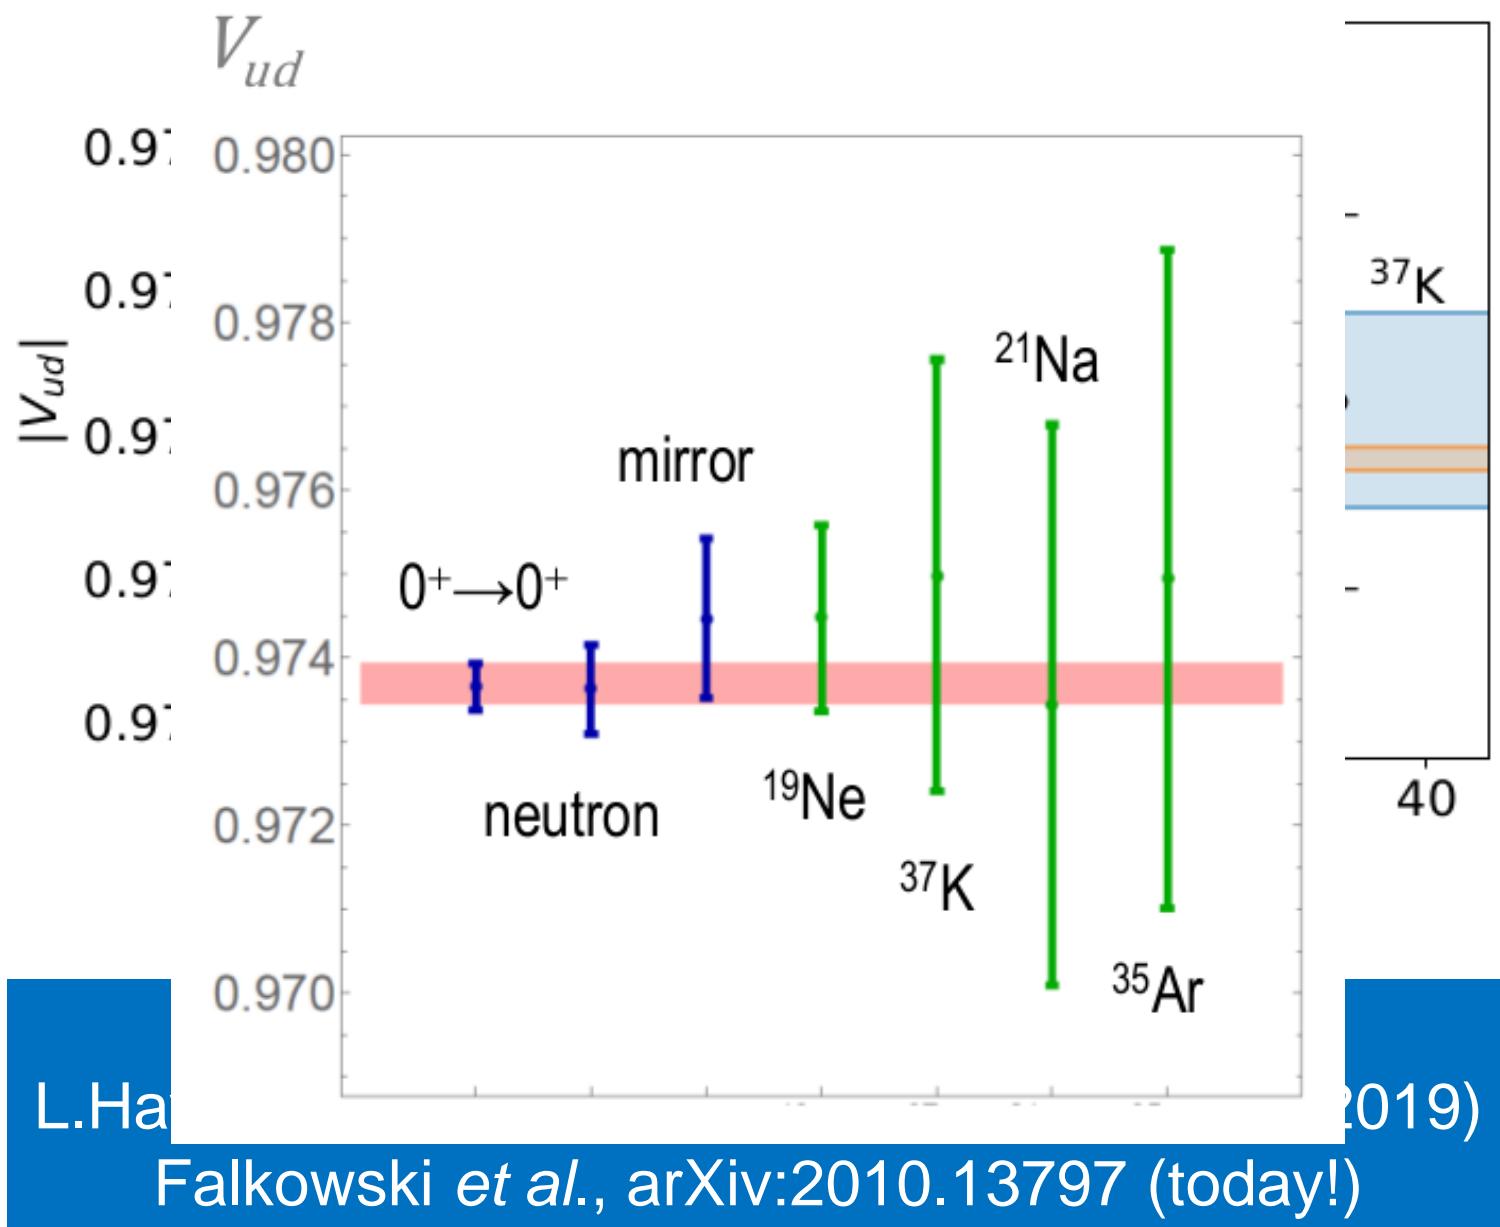

B.Fenker *et al.*, PRL **120**, 062502 (2018)

L.Hayen and N.Severijns, arXiv:1906.09870 (2019)

Interpretation and future prospects

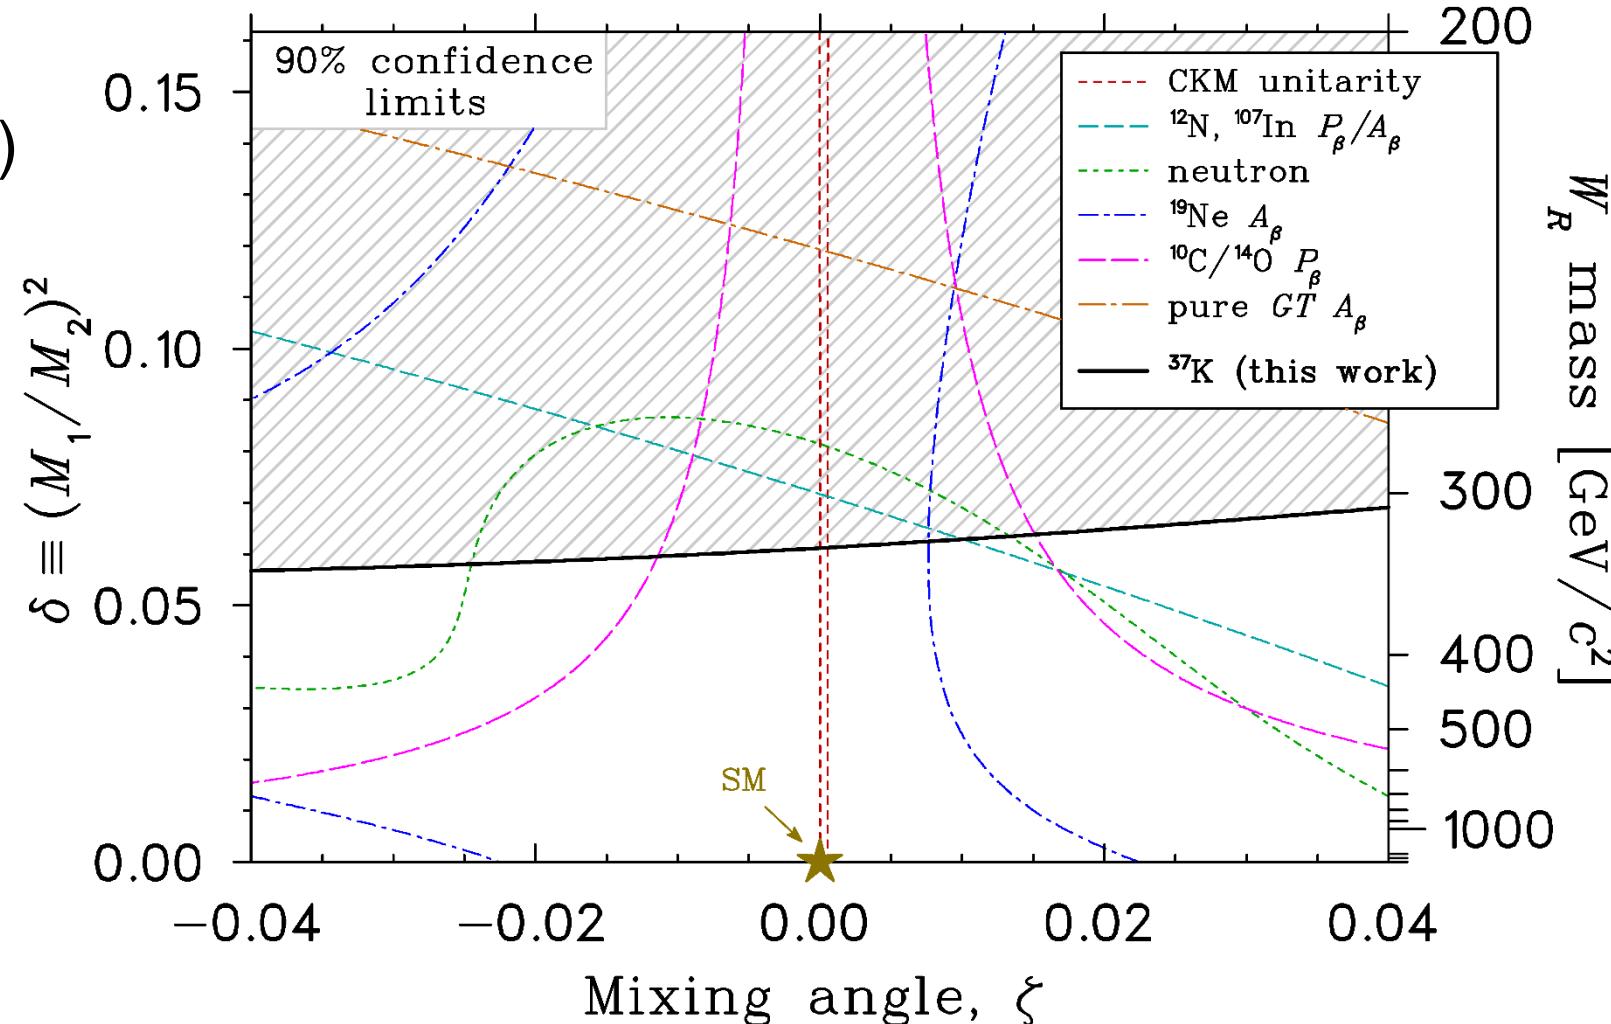

- Comparison of V_{ud} from:

- Mirror nuclei (including ^{37}K)
- The neutron
- Pure Fermi decays

Interpretation and future prospects

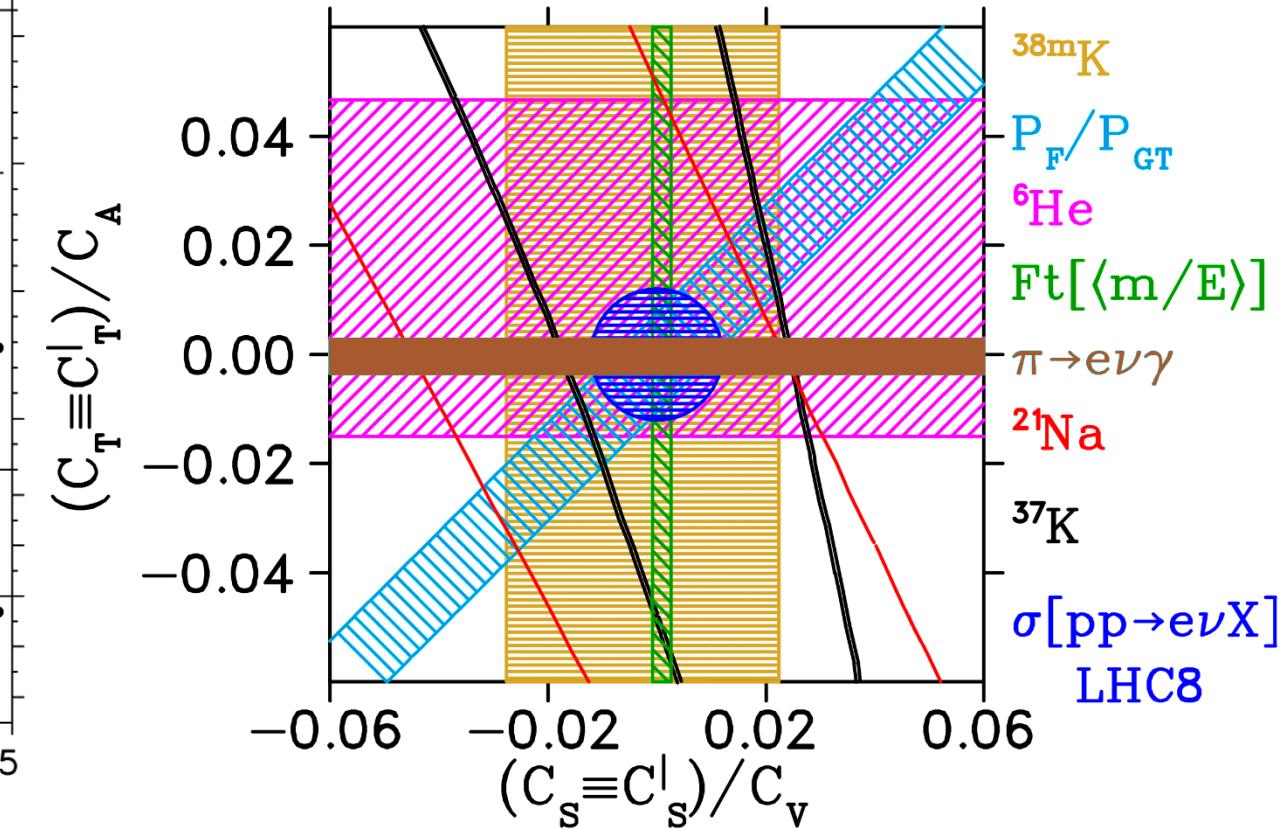

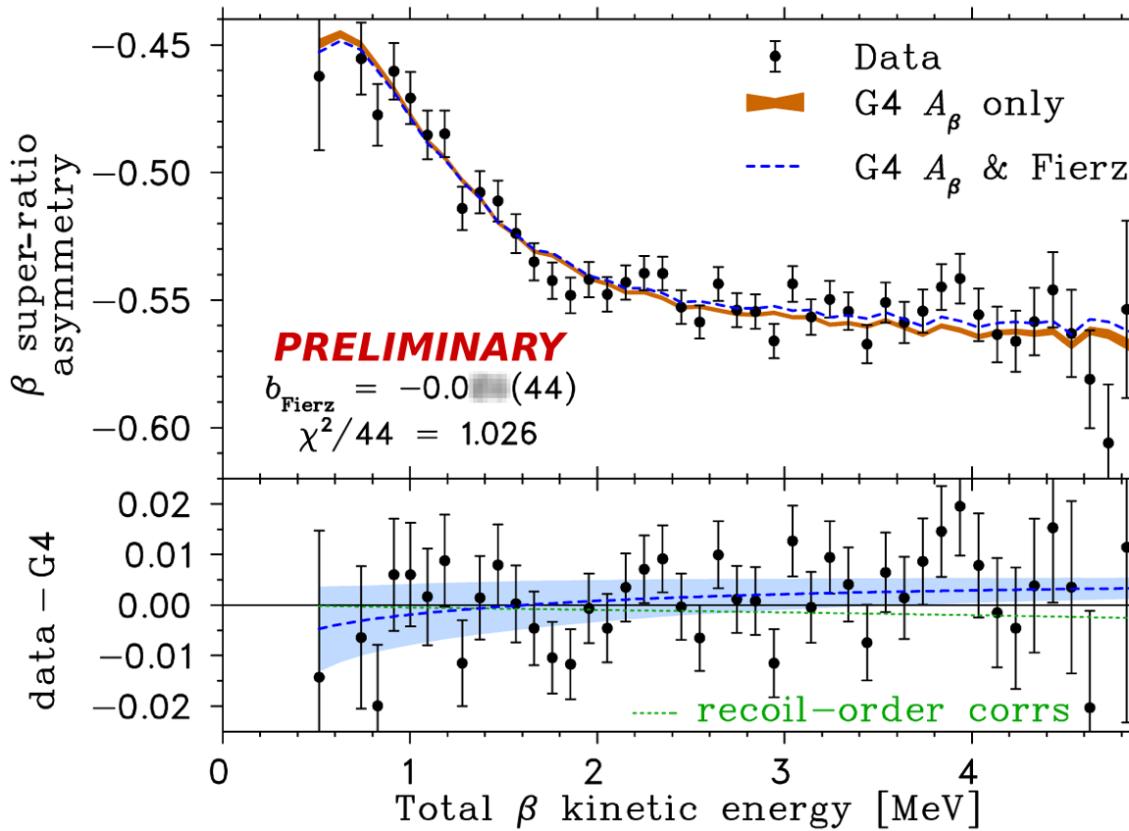

- Comparison of V_{ud} from:
 - ★ Mirror nuclei (including ^{37}K)
 - ★ The neutron
 - ★ Pure Fermi decays
- Also other physics to probe:
 - ★ Right-handed currents
 - ★ 2nd class currents
 - ★ Scalar & tensor currents

B.Fenker *et al*, PRL 120, 062502 (2018)

Future plans

- Complete analysis as a function of $E_\beta \Rightarrow$ Fierz, 2nd class currents
- Improve A_β measurement by 3 – 5 ×

$T = 2, 3/2$ pure Fermi and Gamow-Teller decays

Odd cases: $J^\pi = \frac{5}{2}^+$, $T = \frac{3}{2}$

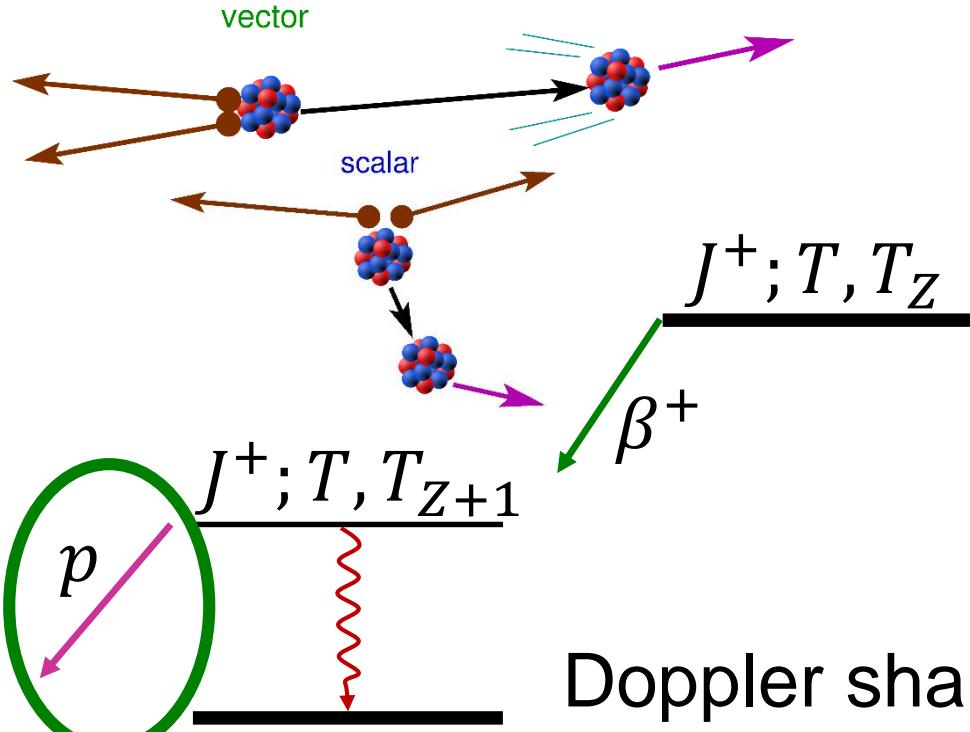

Even cases: $J^\pi = 0^+$, $T = 2$

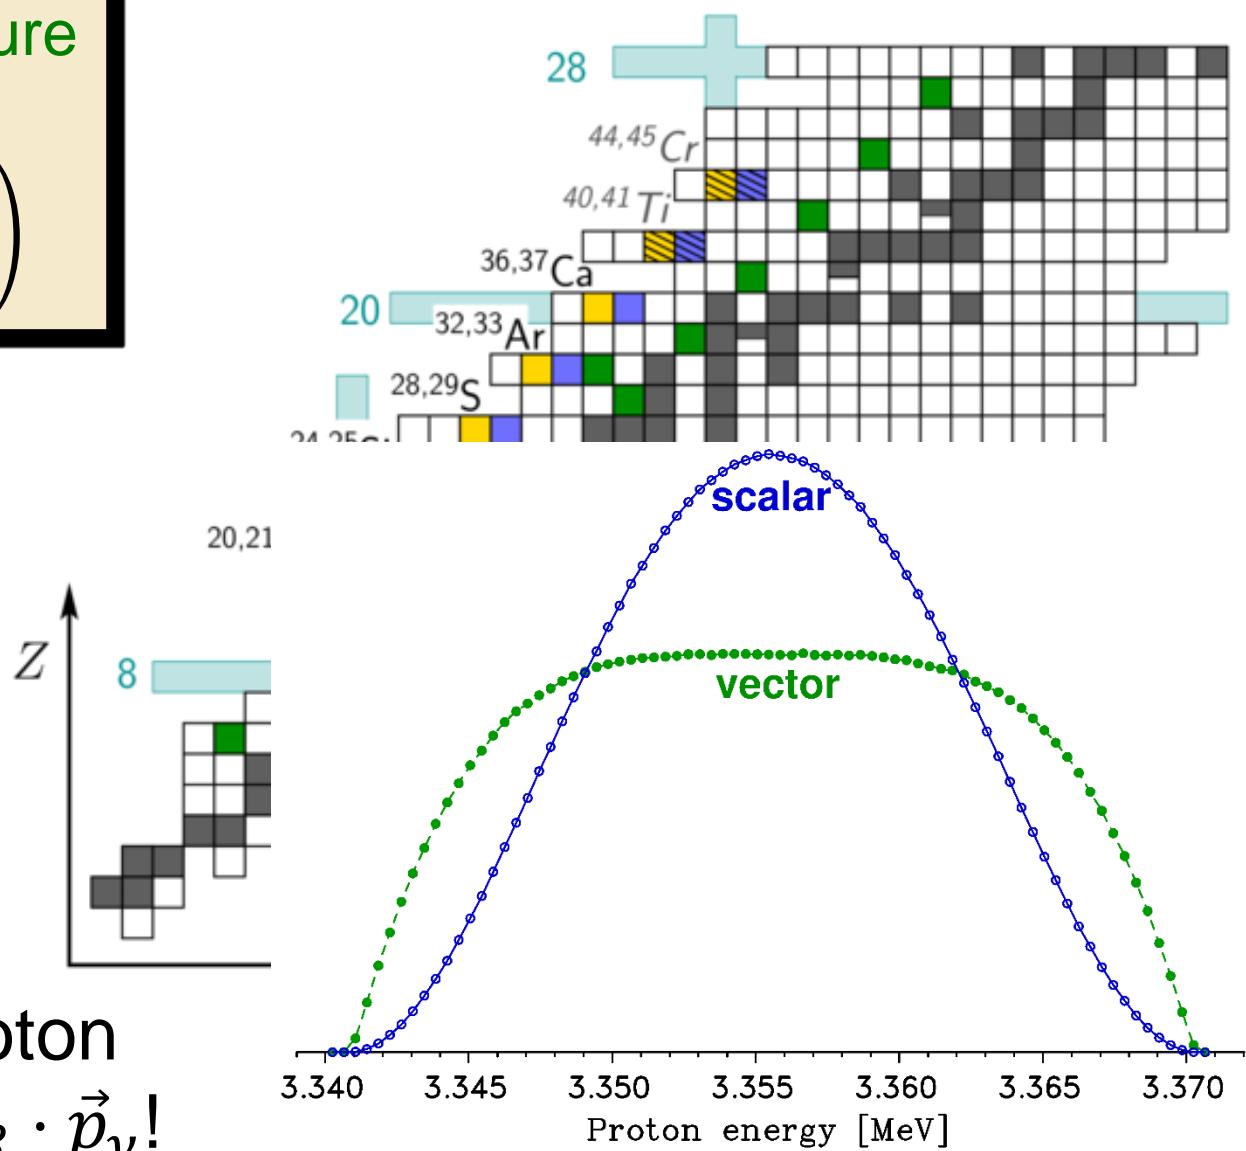

$T = 2, 3/2$ pure Fermi and Gamow-Teller decays

Pure Fermi decay \Rightarrow minimal nuclear structure effects; decay rate is simply given by

$$p_e E_e (A_0 - E_e)^2 \xi \left(1 + a_{\beta\nu} \frac{\vec{p}_e \cdot \vec{p}_\nu}{E_e E_\nu} + b_F \frac{\Gamma m_e}{E_e} \right)$$

Doppler shape of proton energy depends on $\vec{p}_\beta \cdot \vec{p}_\nu$!

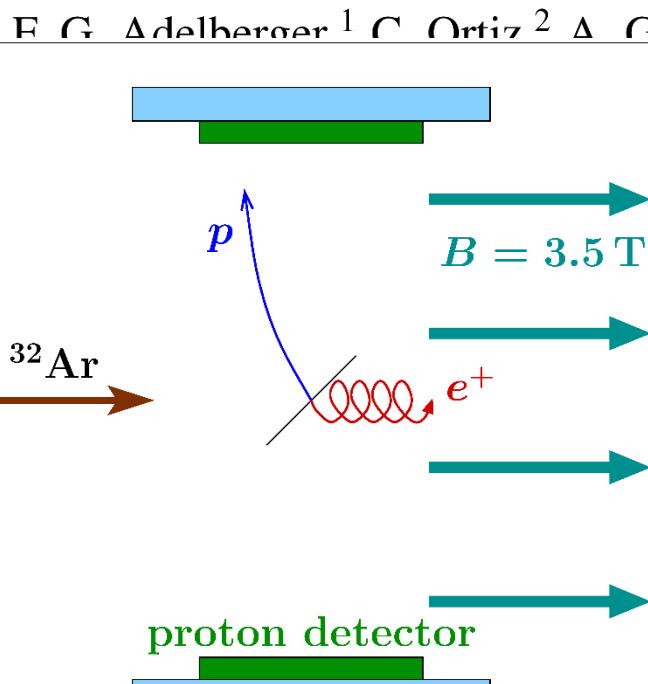

β - ν correlation – A good idea...going back 20 yrs

VOLUME 83, NUMBER 7

16 AUGUST 1999

Positron-Neutrino Correlation in the $0^+ \rightarrow 0^+$ Decay of ^{32}Ar

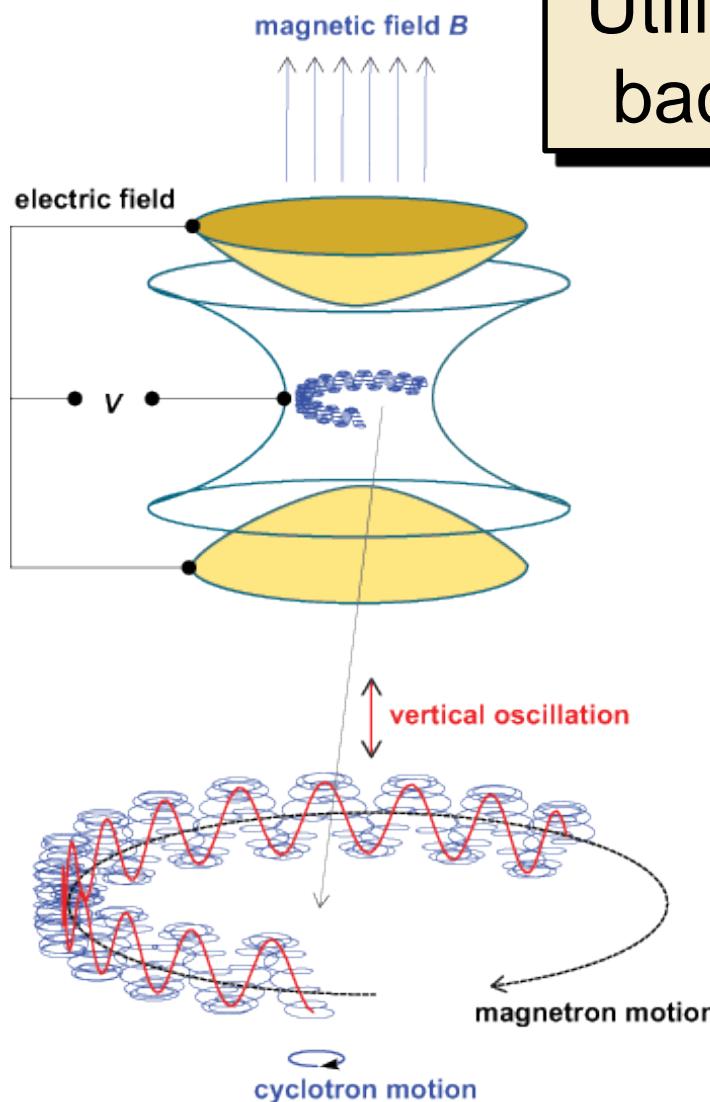

tion in the $0^+ \rightarrow 0^+$ β decay of ^{32}Ar is consistent with the standard model prediction. The present result is in agreement with the standard model prediction. The present result is in agreement with the standard model prediction.

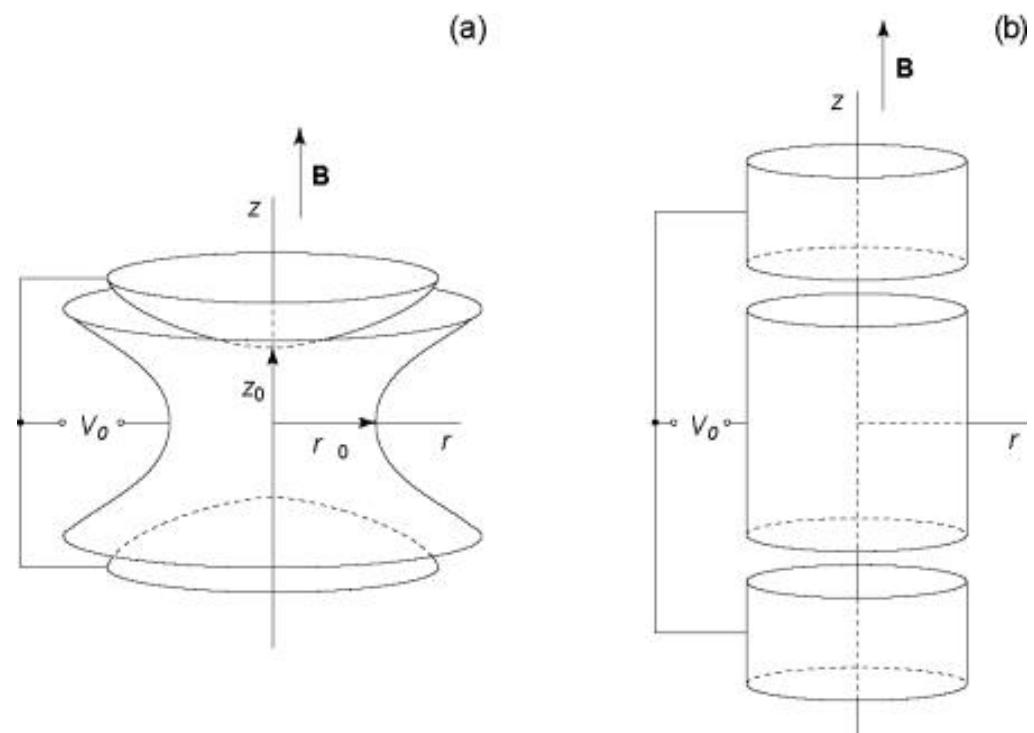

WISArD collab, PRC 101, 055501 (2020)

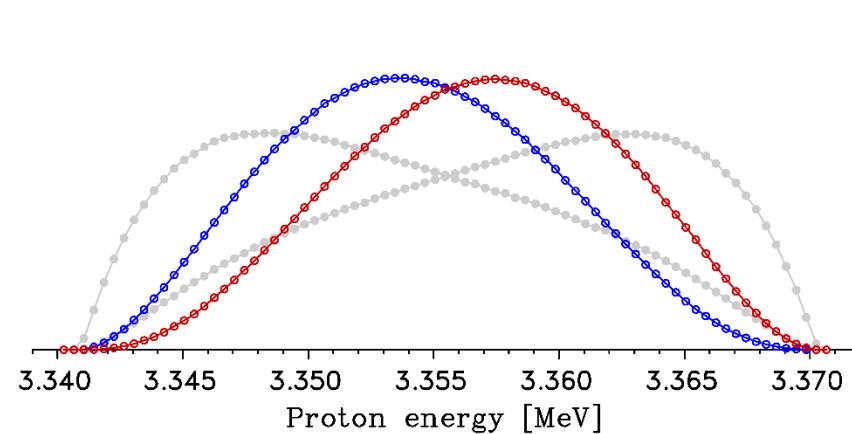

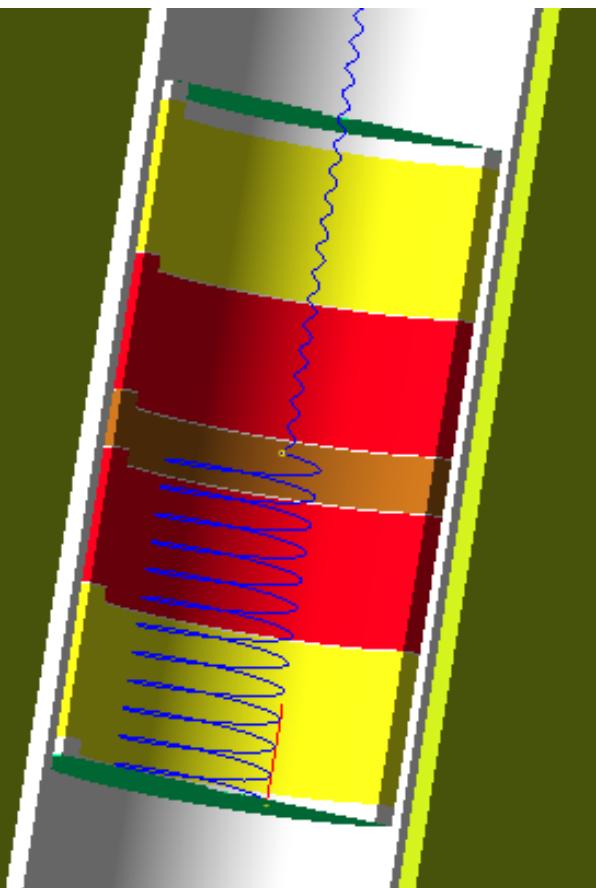

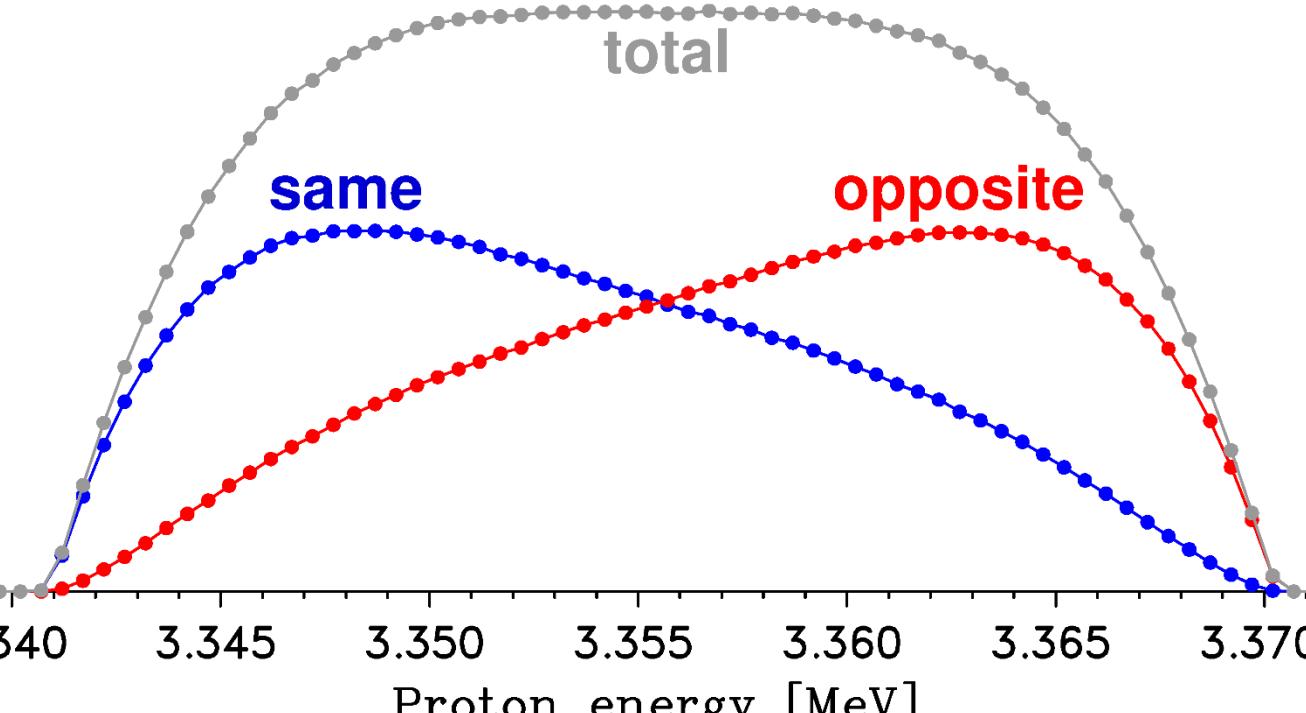

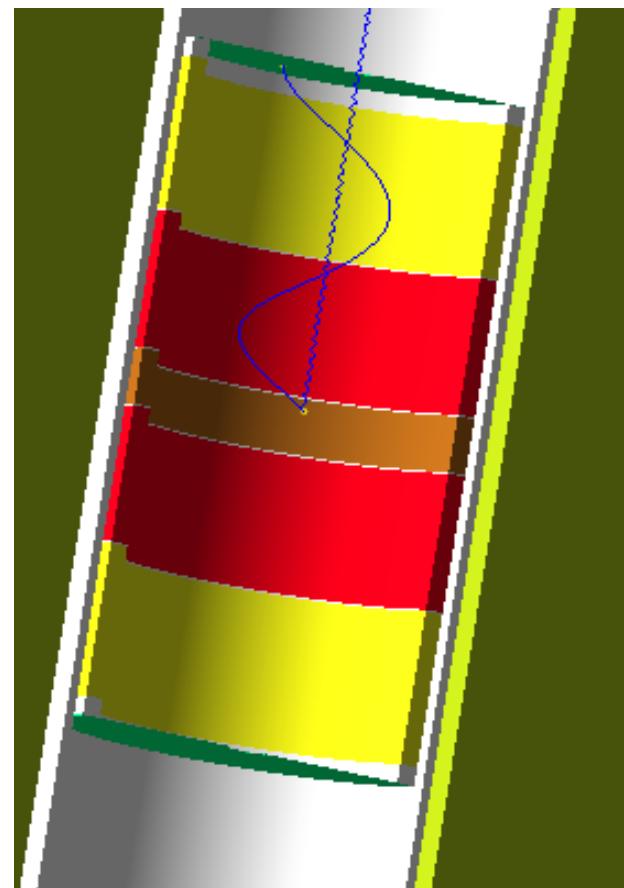

Scattering and energy loss in the foil...

Utilize the technology of Penning traps to provide a backing-free source of localized radioactive ions!!

Measure means instead of 2nd moments

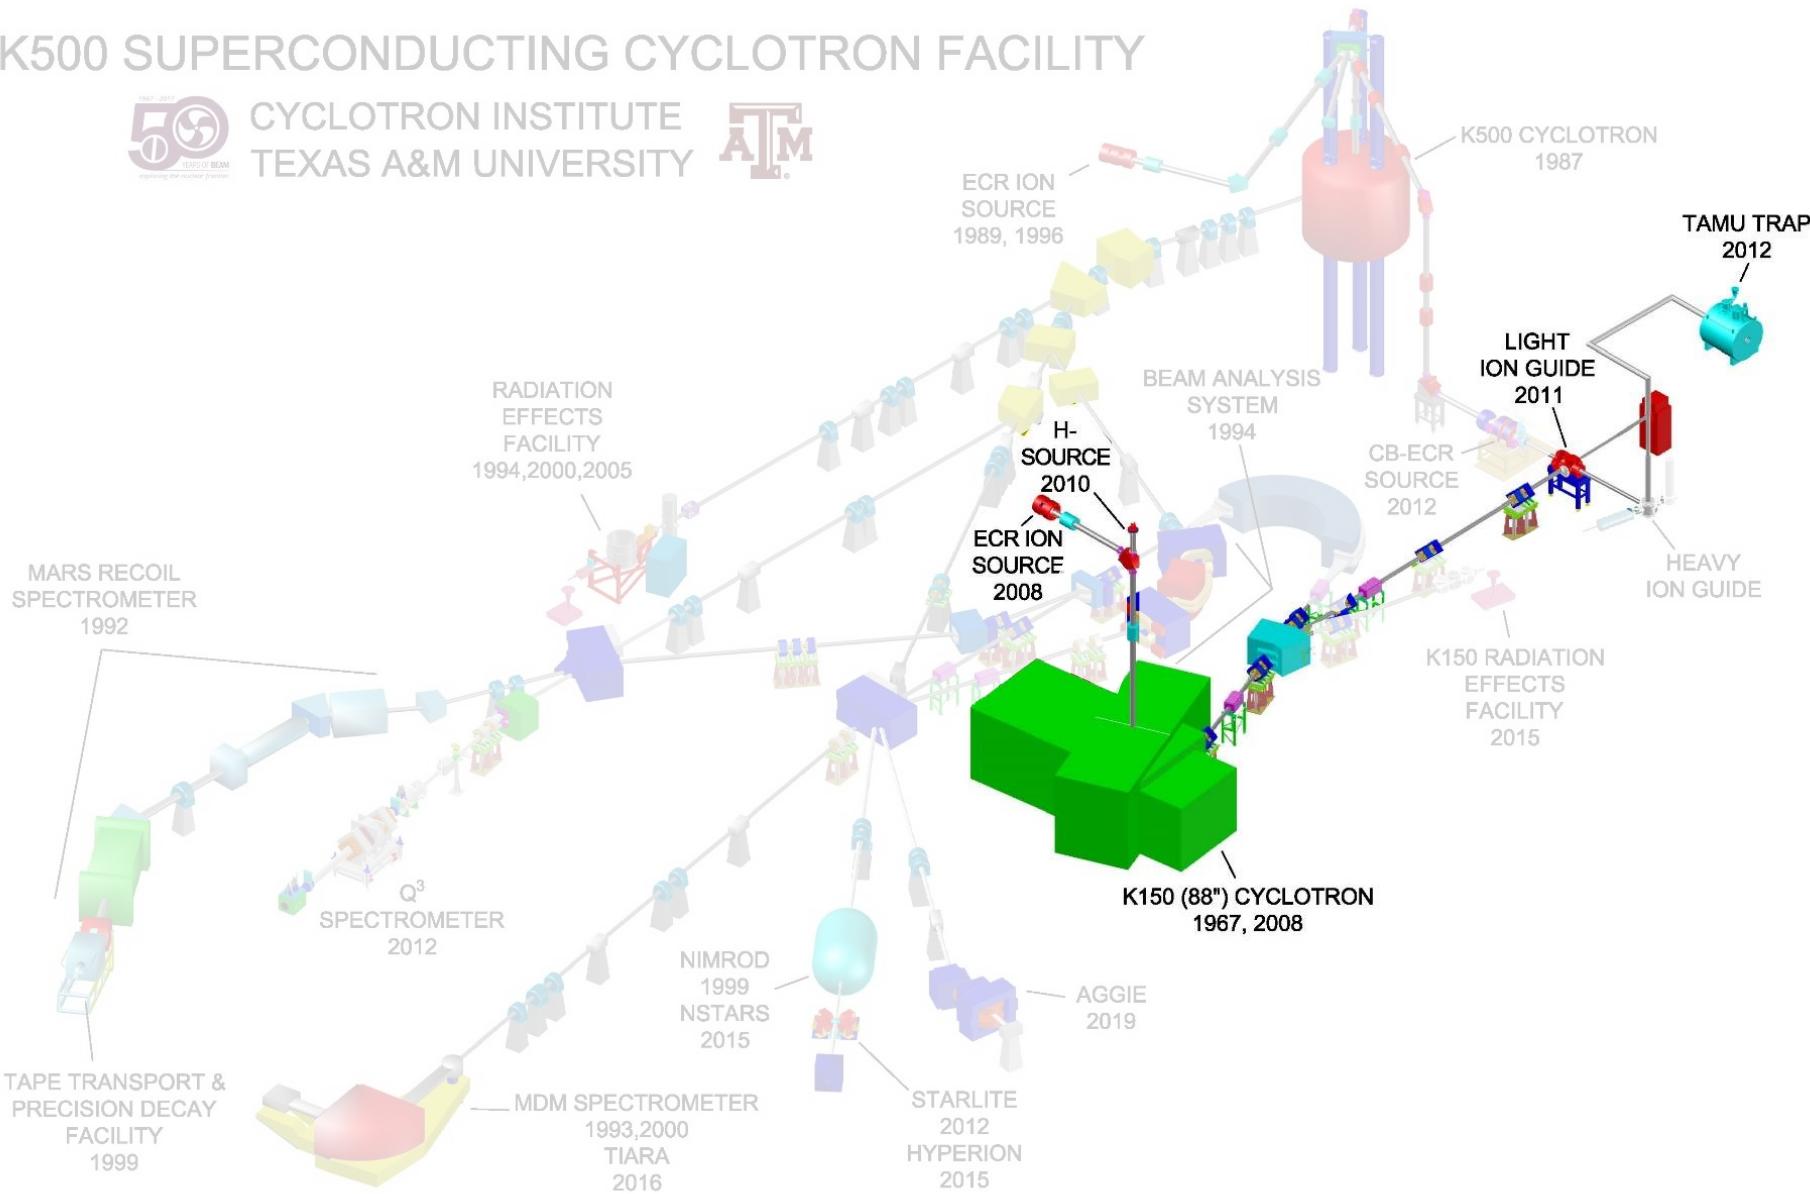

An IGISOL system at the Cyclotron Institute

K500 SUPERCONDUCTING CYCLOTRON FACILITY

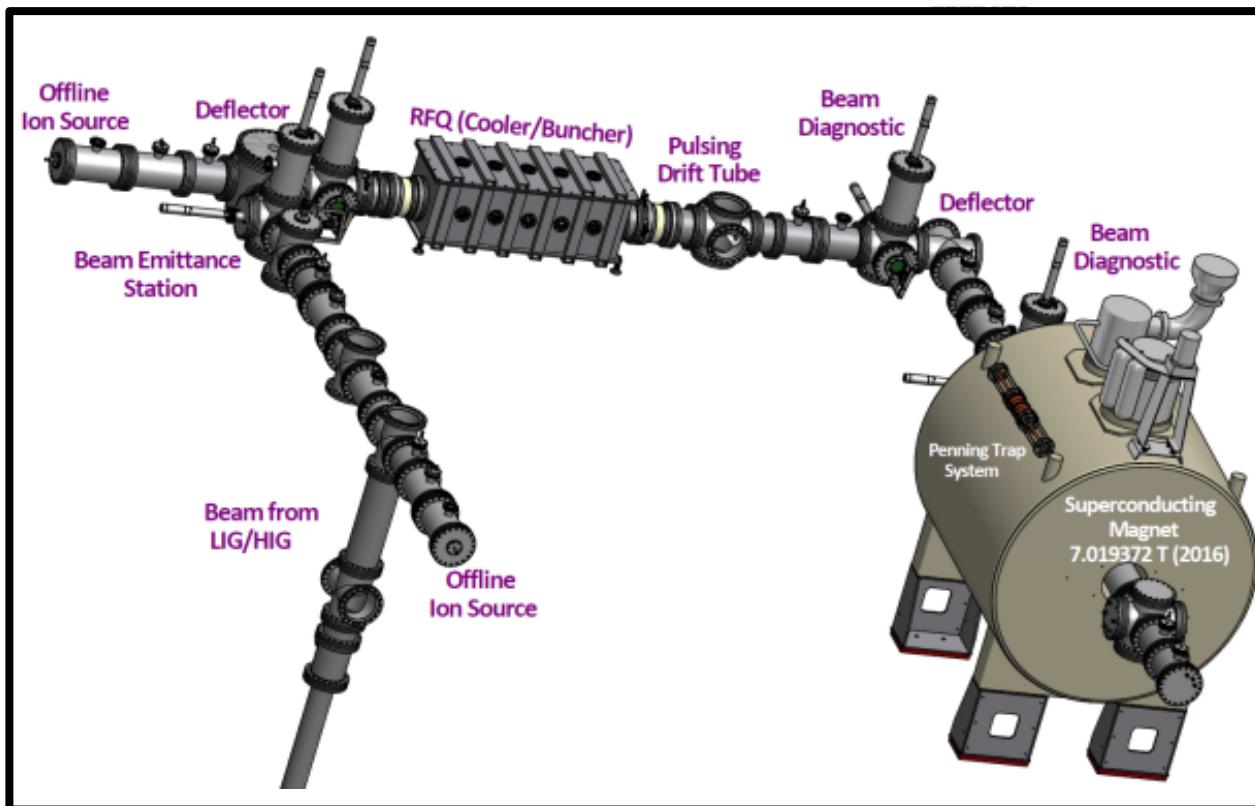

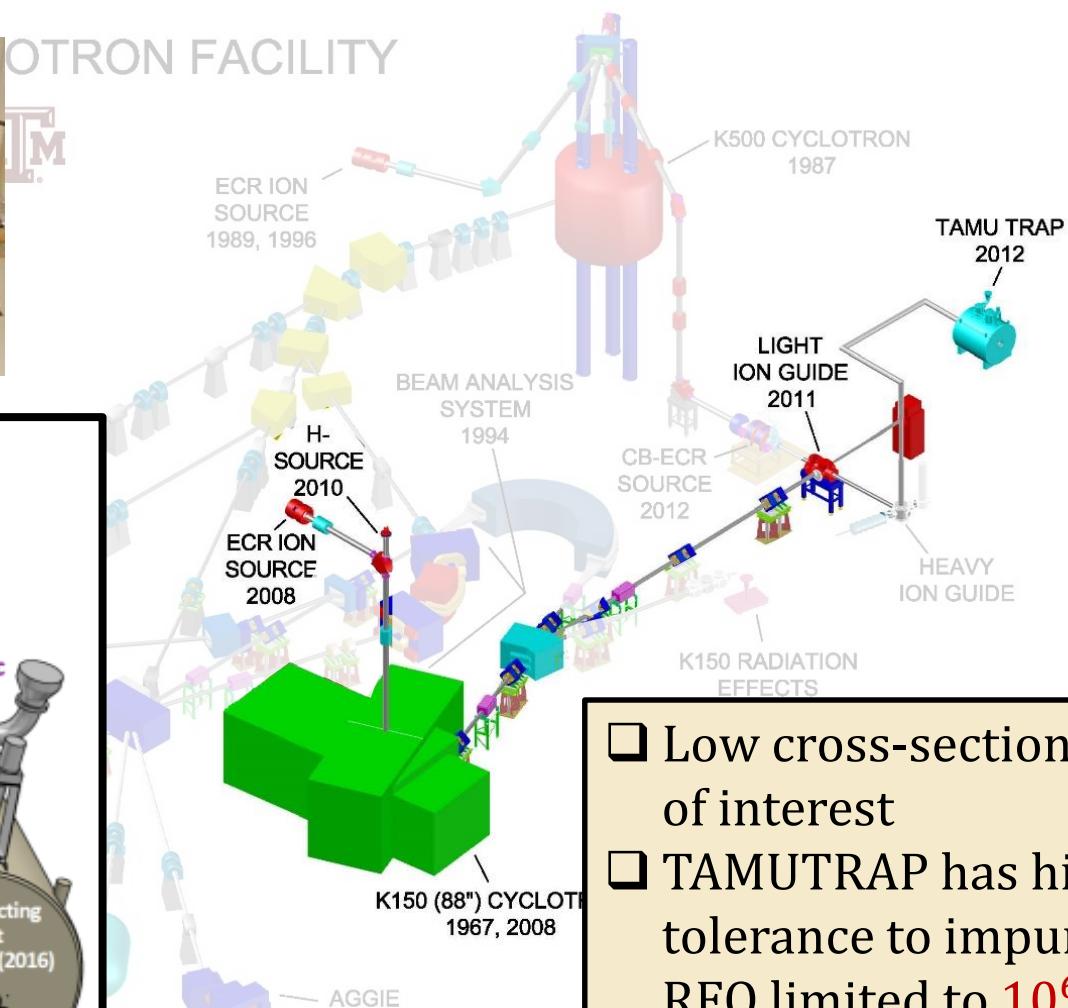

CYCLOTRON INSTITUTE
TEXAS A&M UNIVERSITY

An IGISOL system at the Cyclotron Institute

OTRON FACILITY

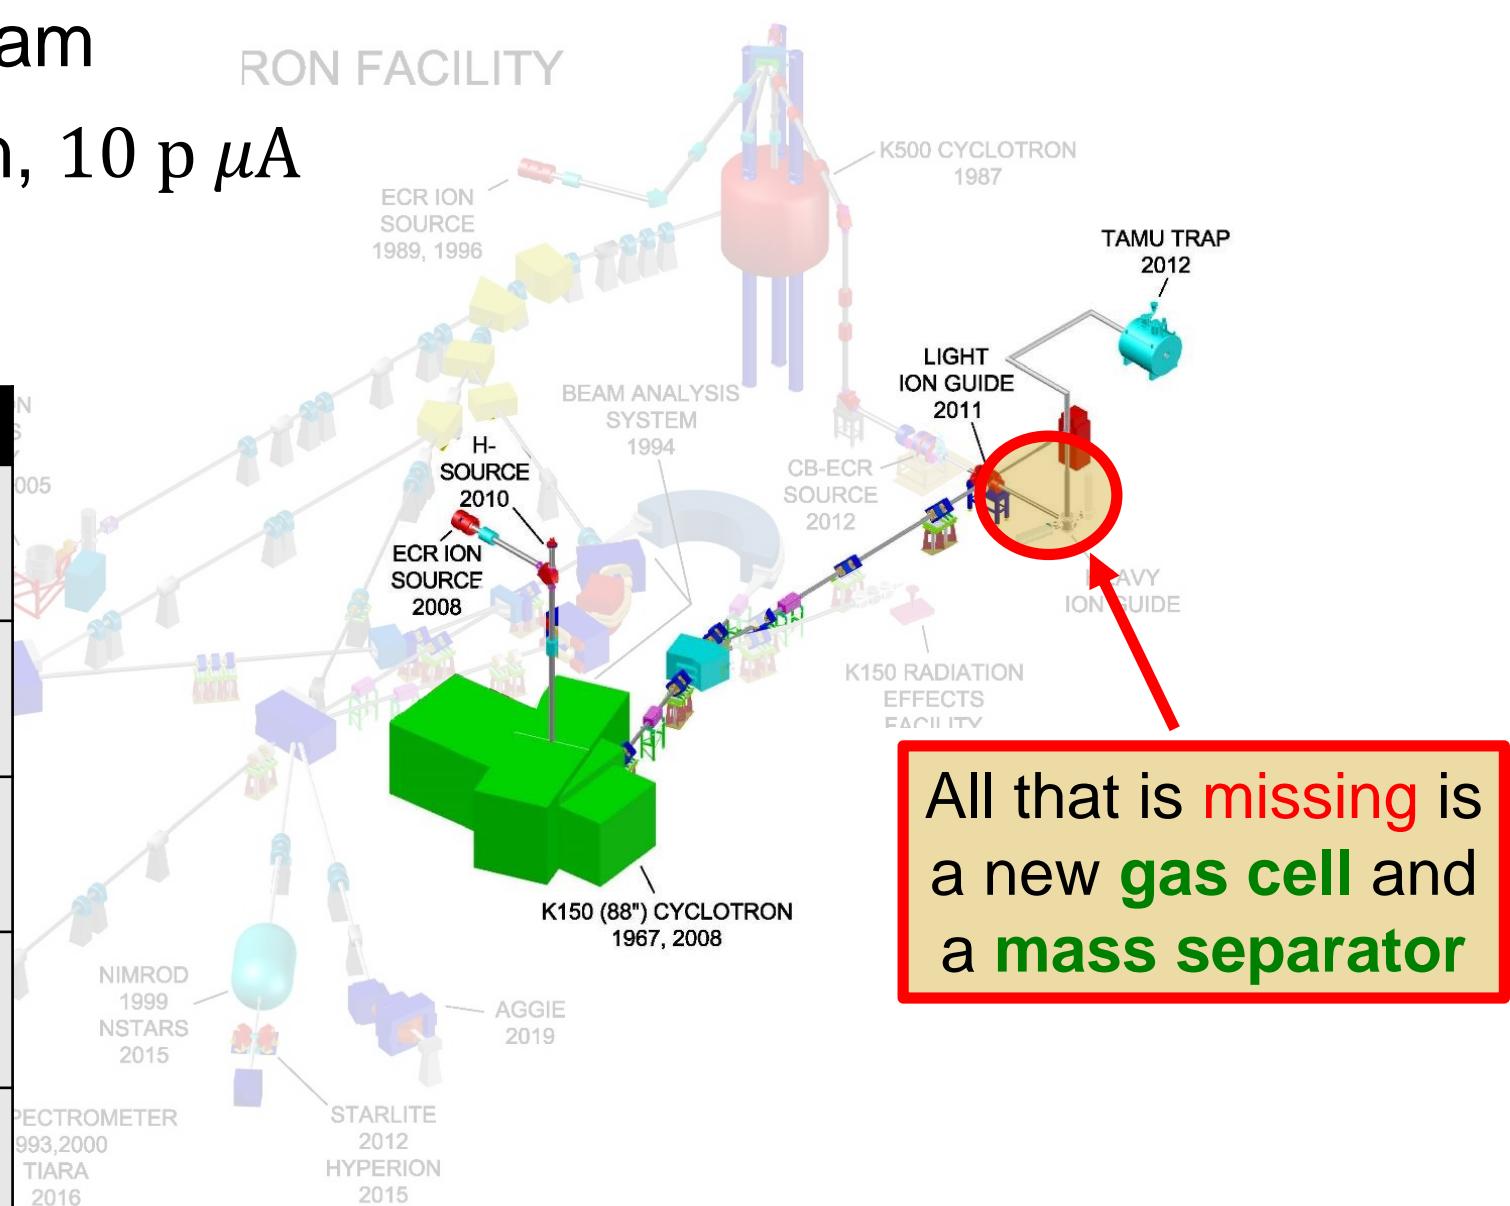

- ❑ Low cross-section for ions of interest
- ❑ TAMUTRAP has high tolerance to impurities, but RFQ limited to 10^6 ions/sec
⇒ Need isobar separation ⇛

Design spec: $M/\Delta M > 2,000$

An IGISOL system at the Cyclotron Institute

- 10-25 MeV/u ^3He primary beam
- Fusion-evaporation reaction, 10 p μA

Target	Product	Production rate
^{20}Ne	^{20}Mg	4×10^3
	^{21}Mg	3×10^5
^{24}Mg	^{24}Si	3×10^3
	^{25}Si	2×10^5
^{28}Si	^{28}S	3×10^3
	^{29}S	8×10^4
^{32}S	^{32}Ar	0.9×10^3
	^{33}Ar	0.9×10^5
^{36}Ar	^{36}Ca	0.2×10^3
	^{37}Ca	0.2×10^5

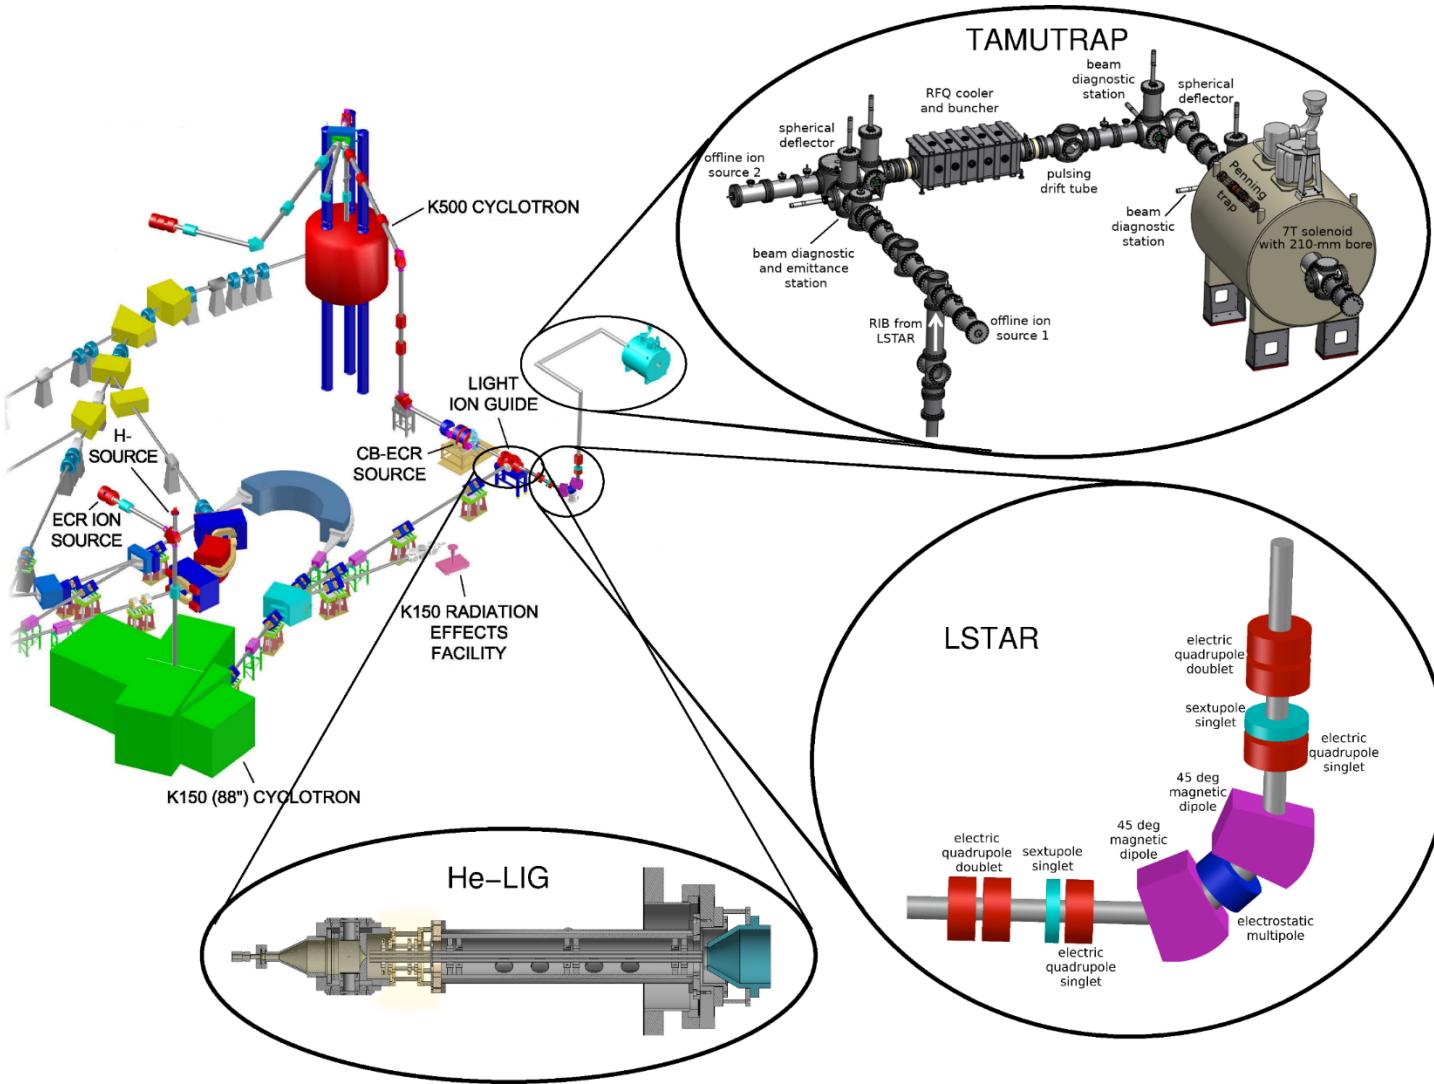

Developing the RIBs for TAMUTRAP

- Efficiency is absolutely critical

- IGISOL at Jyvaskyla quotes 5% efficiency for gas cell
- Gas cell [5%] → separator [85%]
 - cooler/buncher [20%]
 - Penning trap
- Estimate for rates of proton-rich nuclei in the trap:

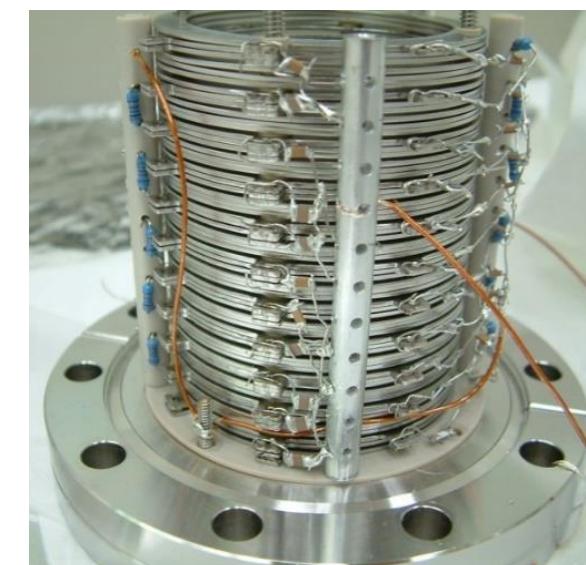

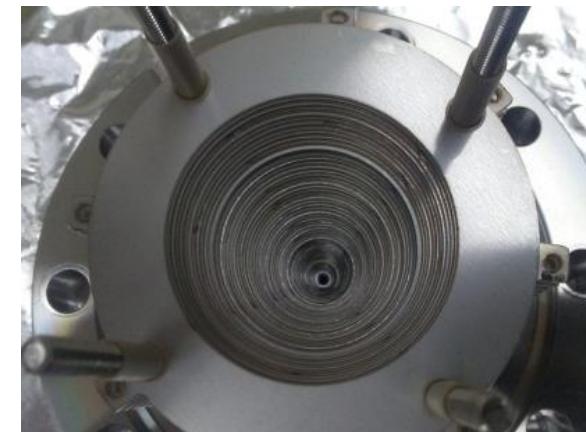

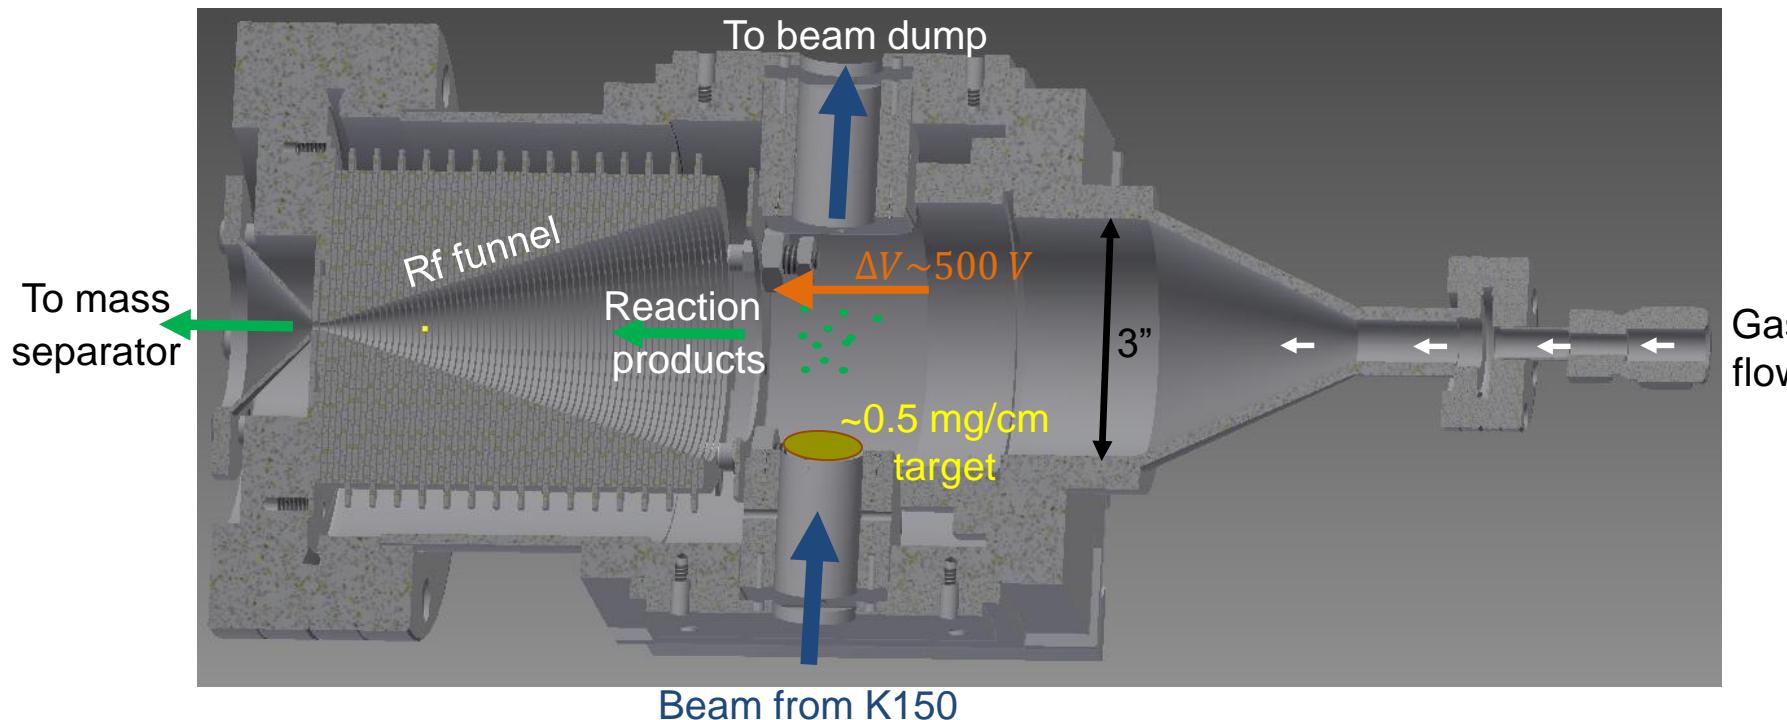

^{21}Mg	2650
^{25}Si	1425
^{29}S	850
^{33}Ar	760
^{37}Ca	190

^{20}Mg	40
^{24}Si	30
^{28}S	25
^{32}Ar	10
^{36}Ca	2

We have been developing a new gas cells

- We have tried testing a gas cell with rf
 - ★ May enhance ion transport, reduce interactions with cell walls
 - ★ Plasma effects always cast doubt on viability...

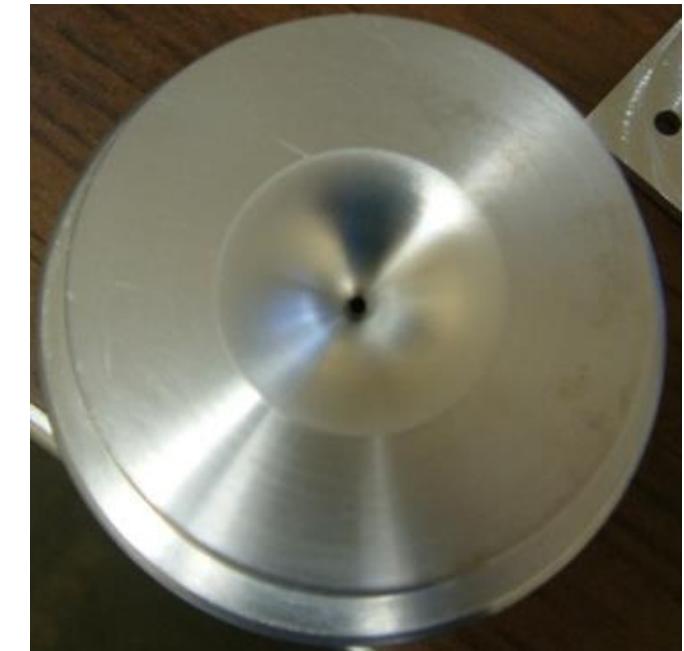

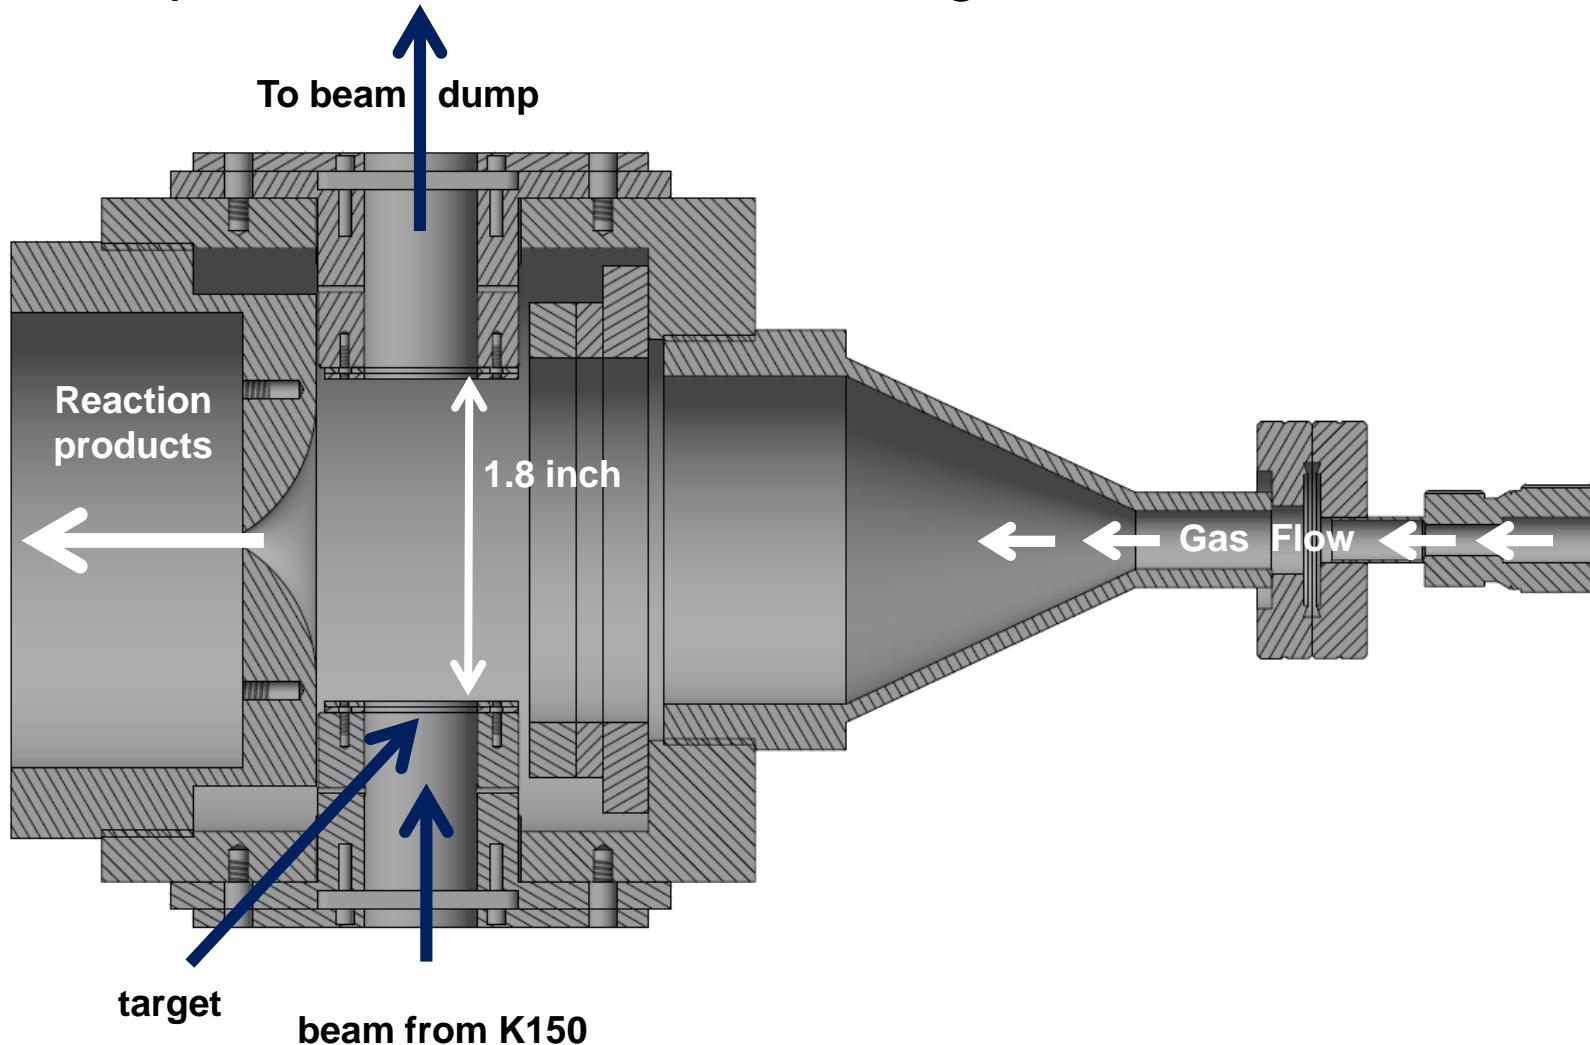

- ★ Results to date have been inconclusive (bad vacuum, connection issues, ...); shelving this for now

We have been developing a new gas cell

- Also testing a typical (gas-only cell)

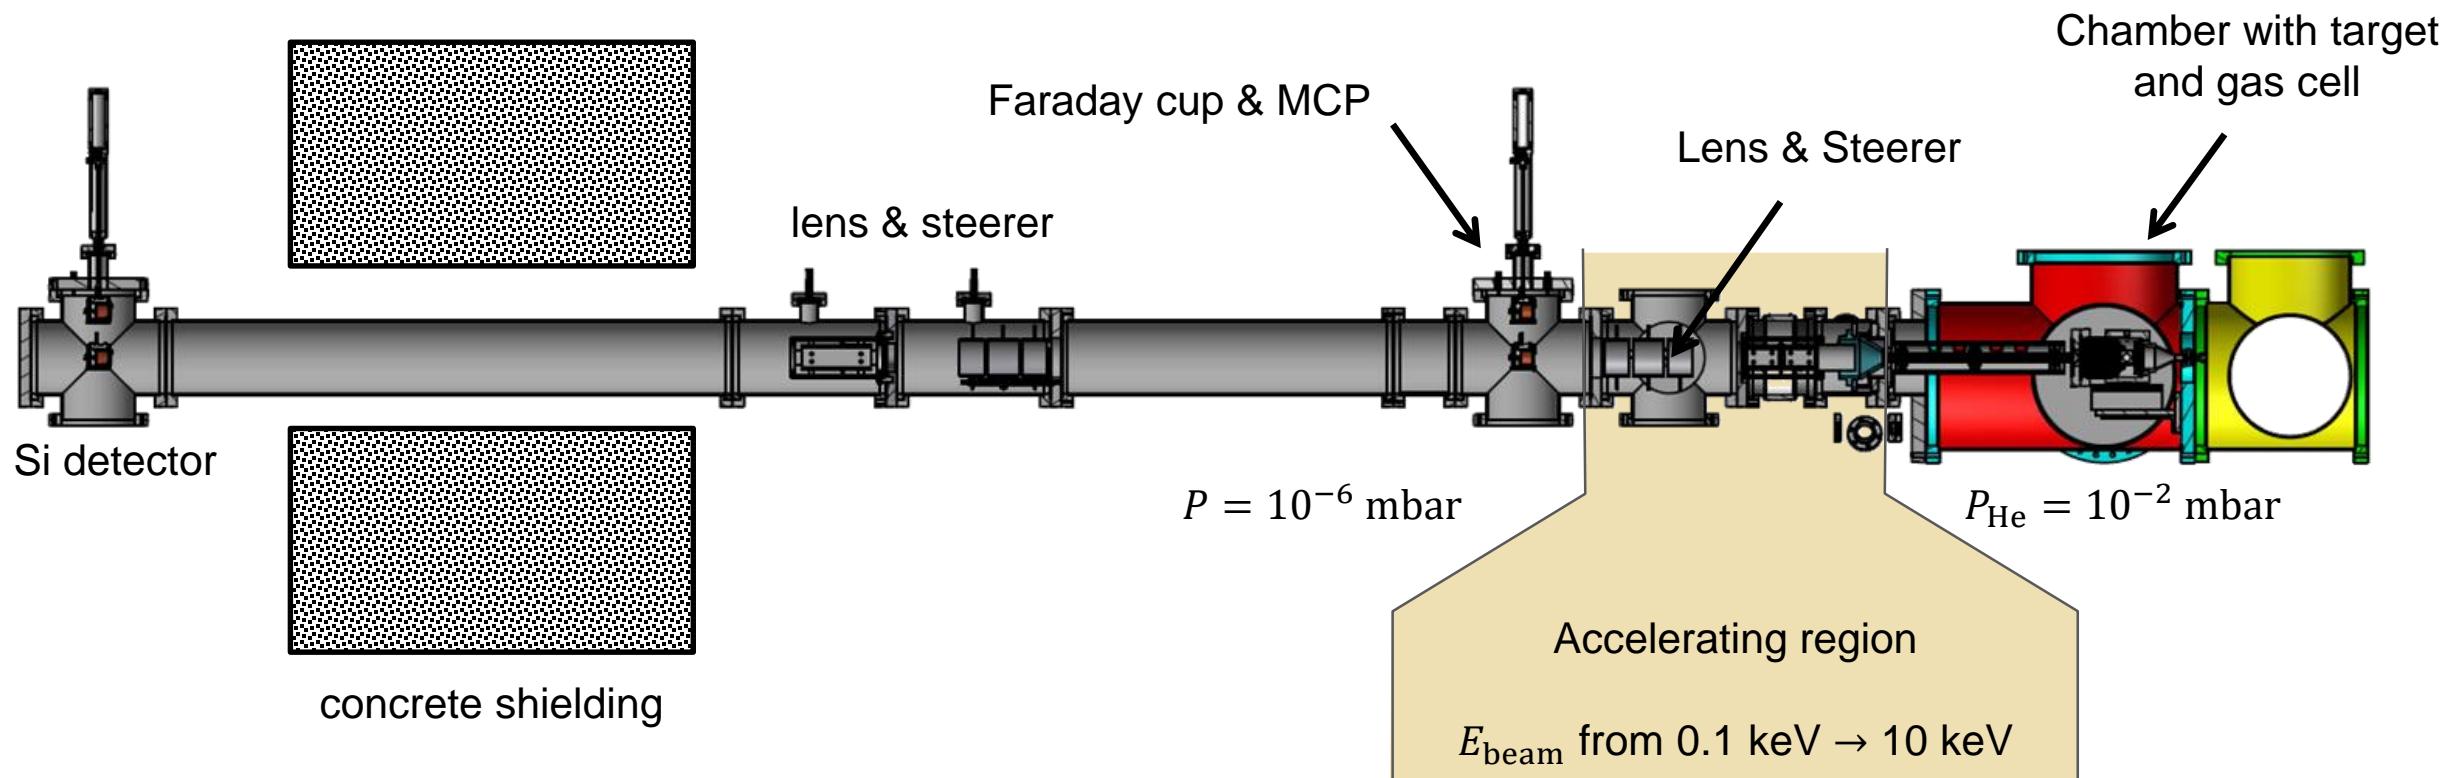

- Simpler than with rf; shorter length

We have been developing a new gas cell

- Also testing a typical (gas-only cell)

- Simpler than with rf; shorter length

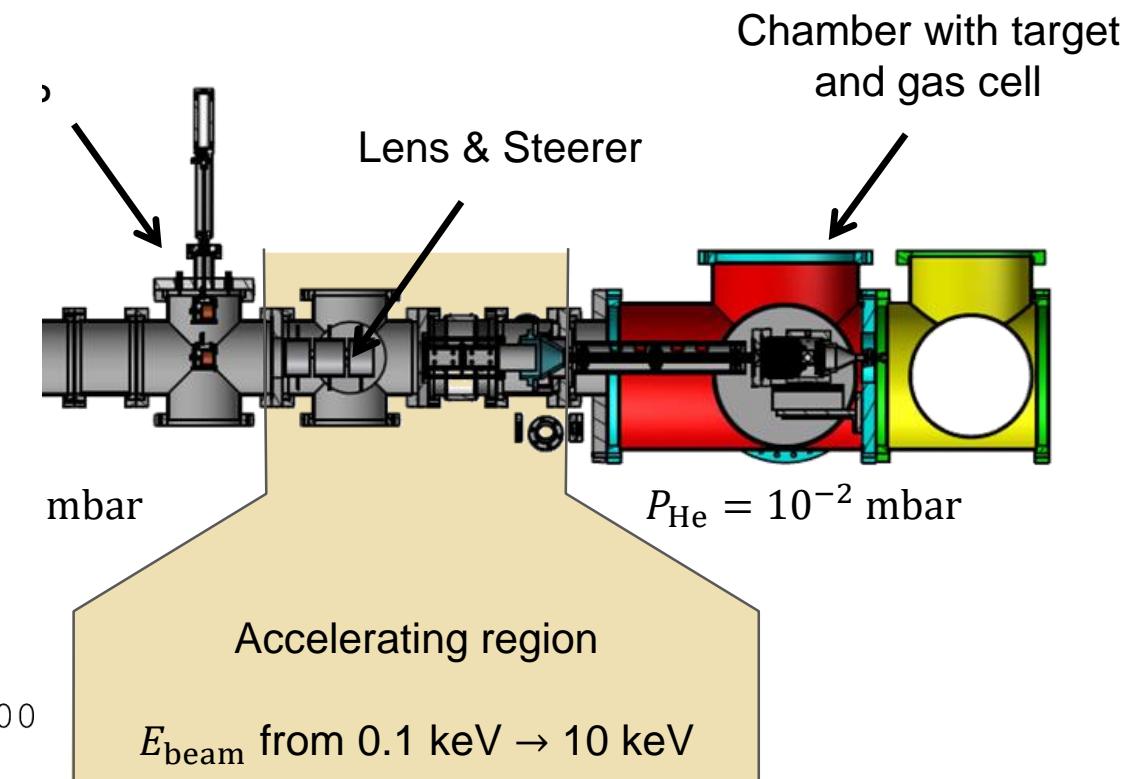

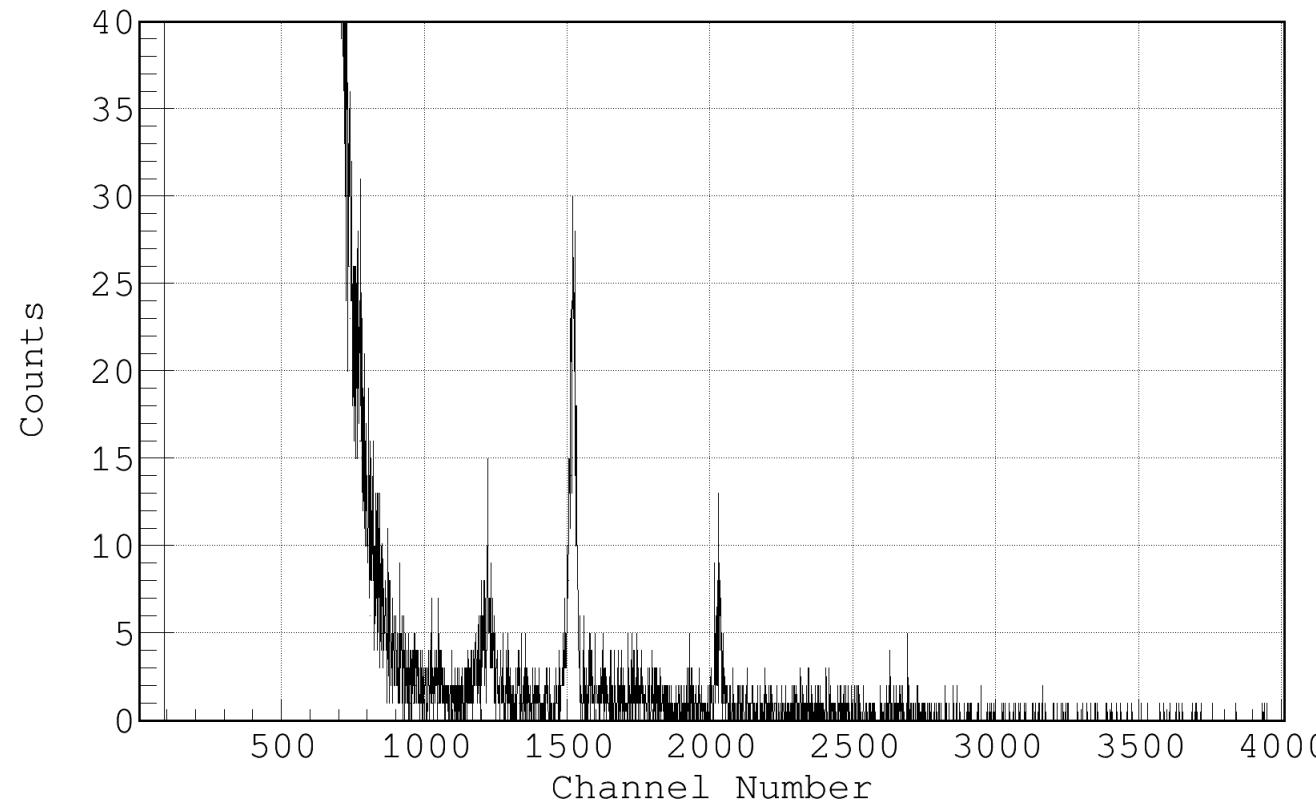

We have been developing a new gas cell

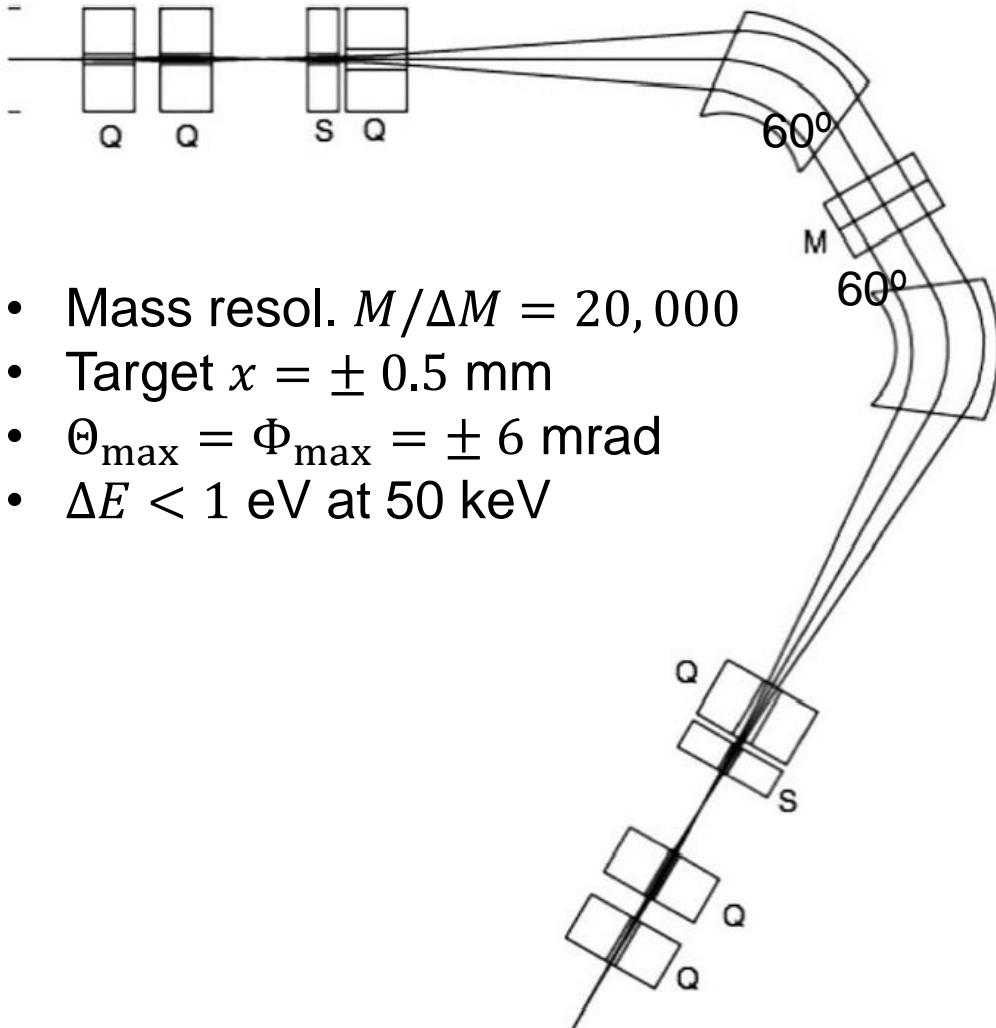

- Also testing a typical (gas-only cell)
- Simpler than with rf; shorter length

Efficiency of ^{25}Si production already
0.13(2)%!!

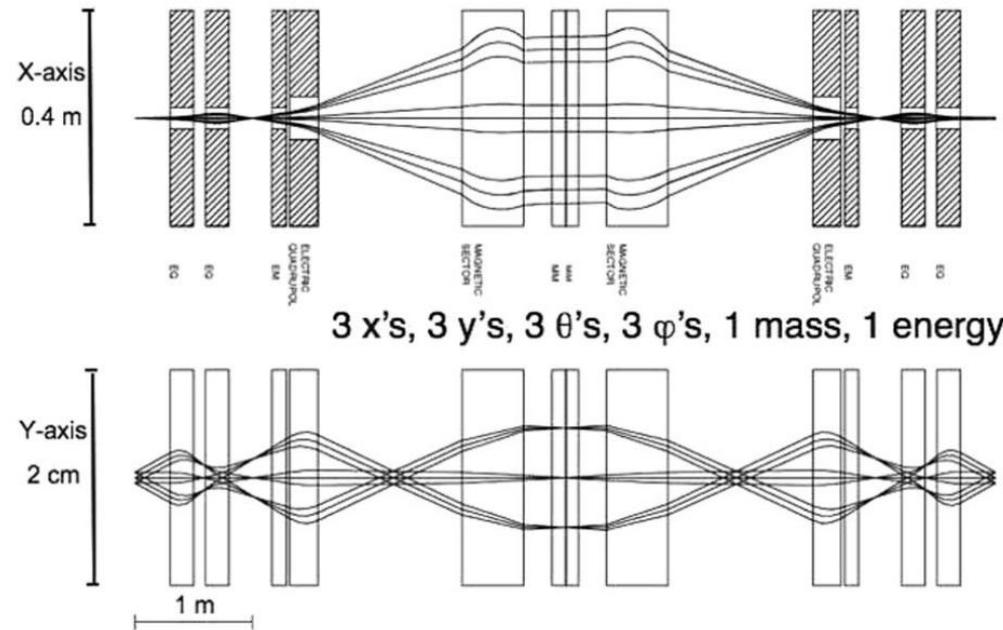

1–2% no problem; 5% is achievable

Concept for mass separator – CARIBU @ ANL

- Mass resol. $M/\Delta M = 20,000$
- Target $x = \pm 0.5$ mm
- $\Theta_{\max} = \Phi_{\max} = \pm 6$ mrad
- $\Delta E < 1$ eV at 50 keV

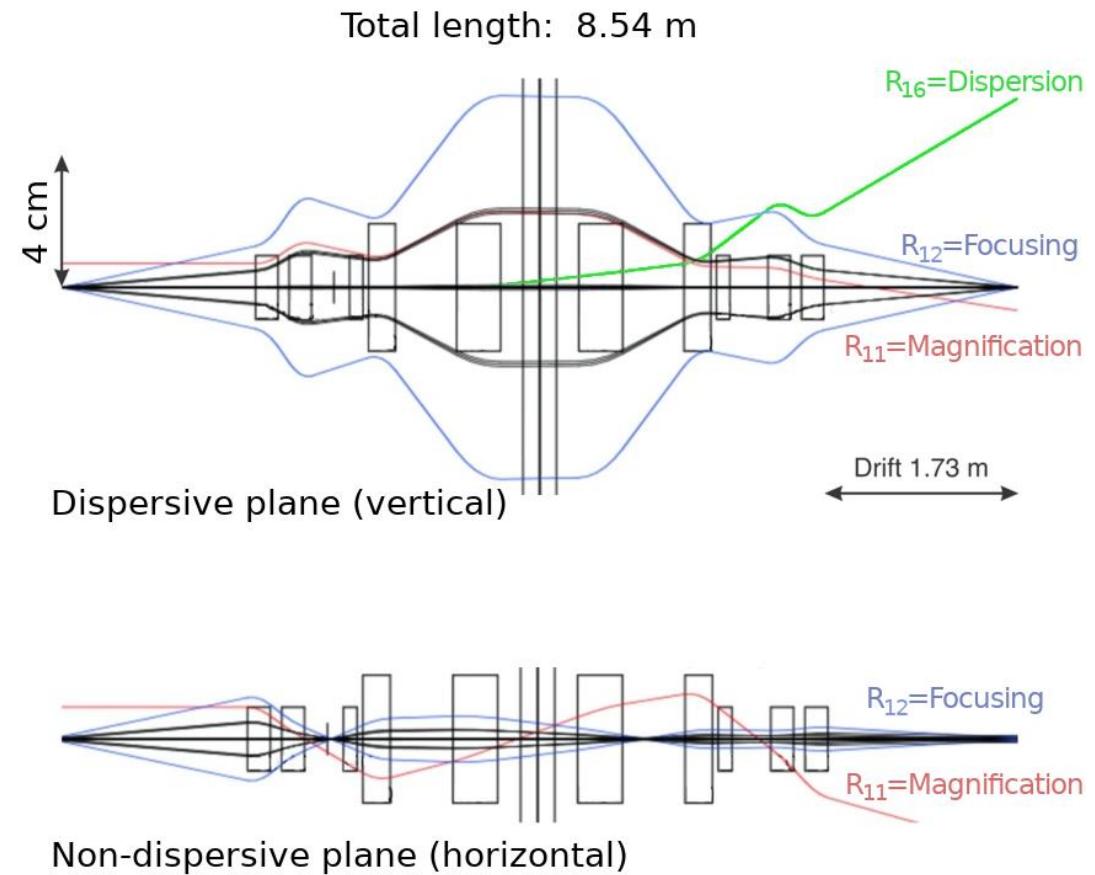

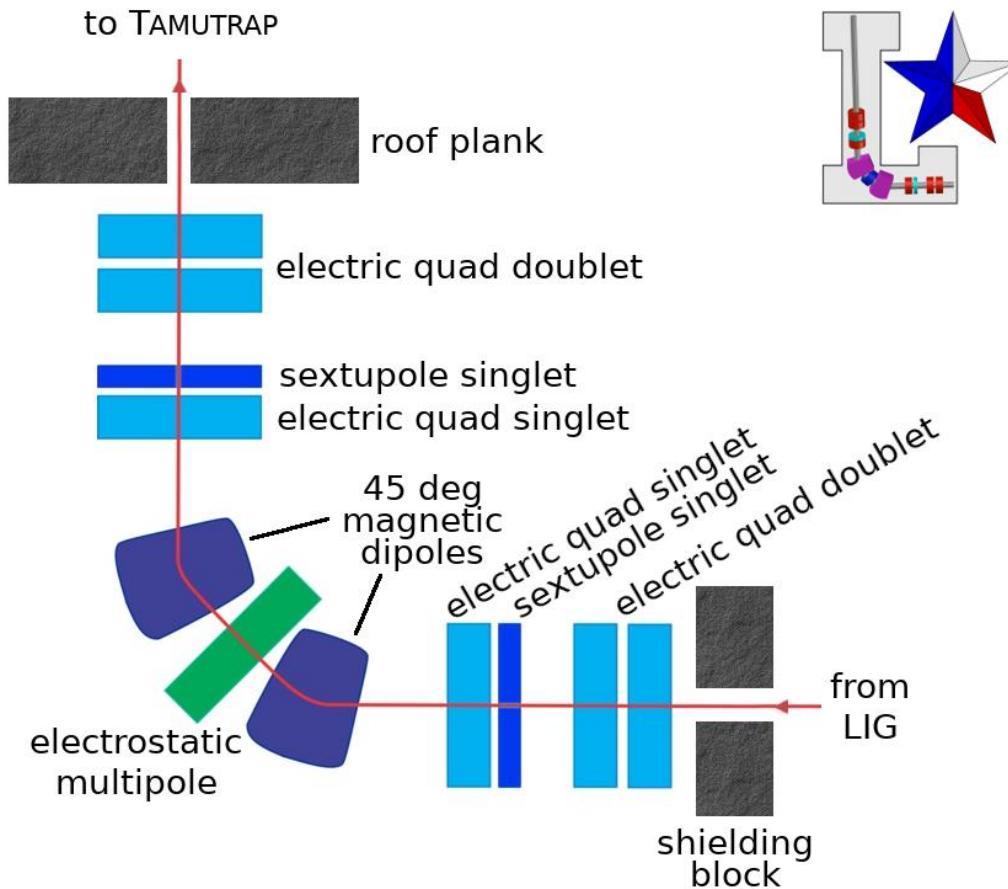

ptics of the isobar separator in the x - (dispersive) and y - (non-dispersive) planes. Note the different scales in the two planes.

Fig. 1. Layout of the isobar separator, showing the two 60° bending magnets with $\rho = 0.5$ m, two quadrupole (Q) doublets, two quadrupole singlets, two sextupole (S) singlets and an electrostatic multipole (M).

Davids and Peterson,
NIMB 266, 4449 (2008)

But 120° doesn't fit our existing equipment...

- To bend up, need 45° + 45° instead
- Collaborate with G. Berg, M. Couder and M. Brodeur (ND) to build the Light-ion guide Separator for TAMU's K150 RIBs

LSTAR performance specs and status

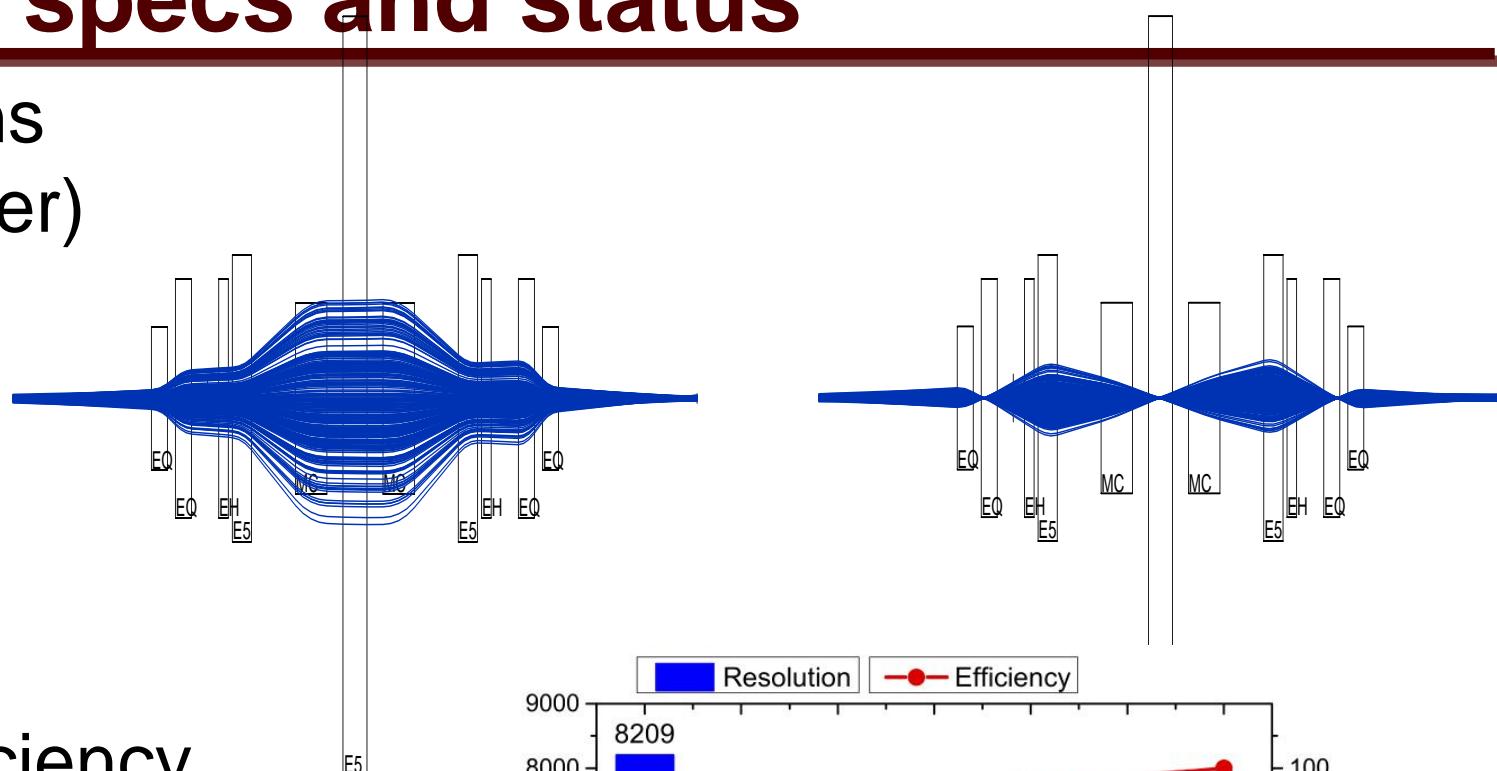

- With higher-order aberrations corrected (G. Berg, M. Couder)

Cuts: $\theta_x, \theta_y = \pm 2$ mrad

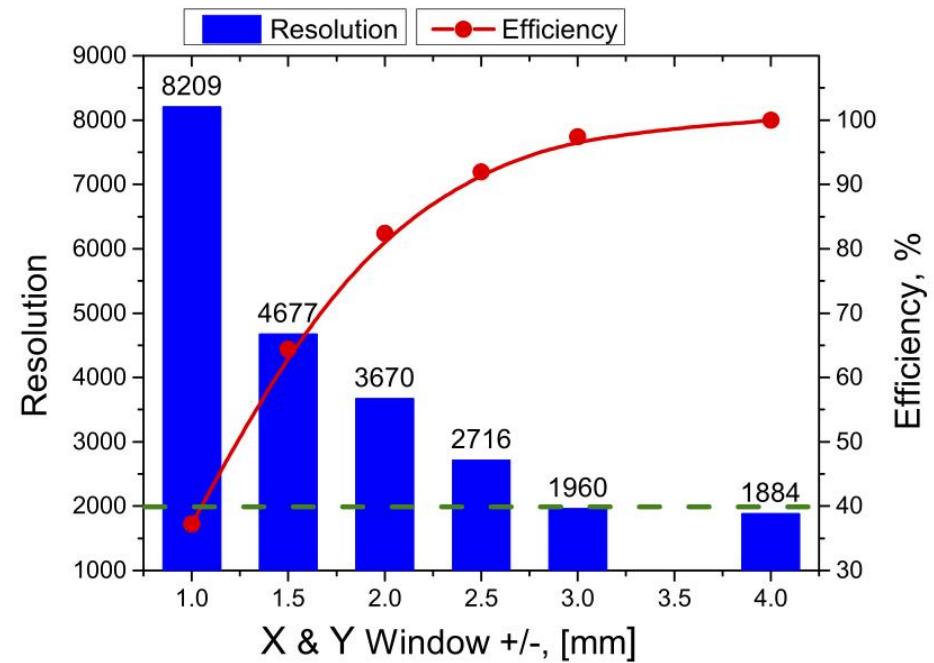

$x, y = \pm 2$ mm

Resolution: $\frac{M}{\Delta M} = 4400$

Efficiency: 81%

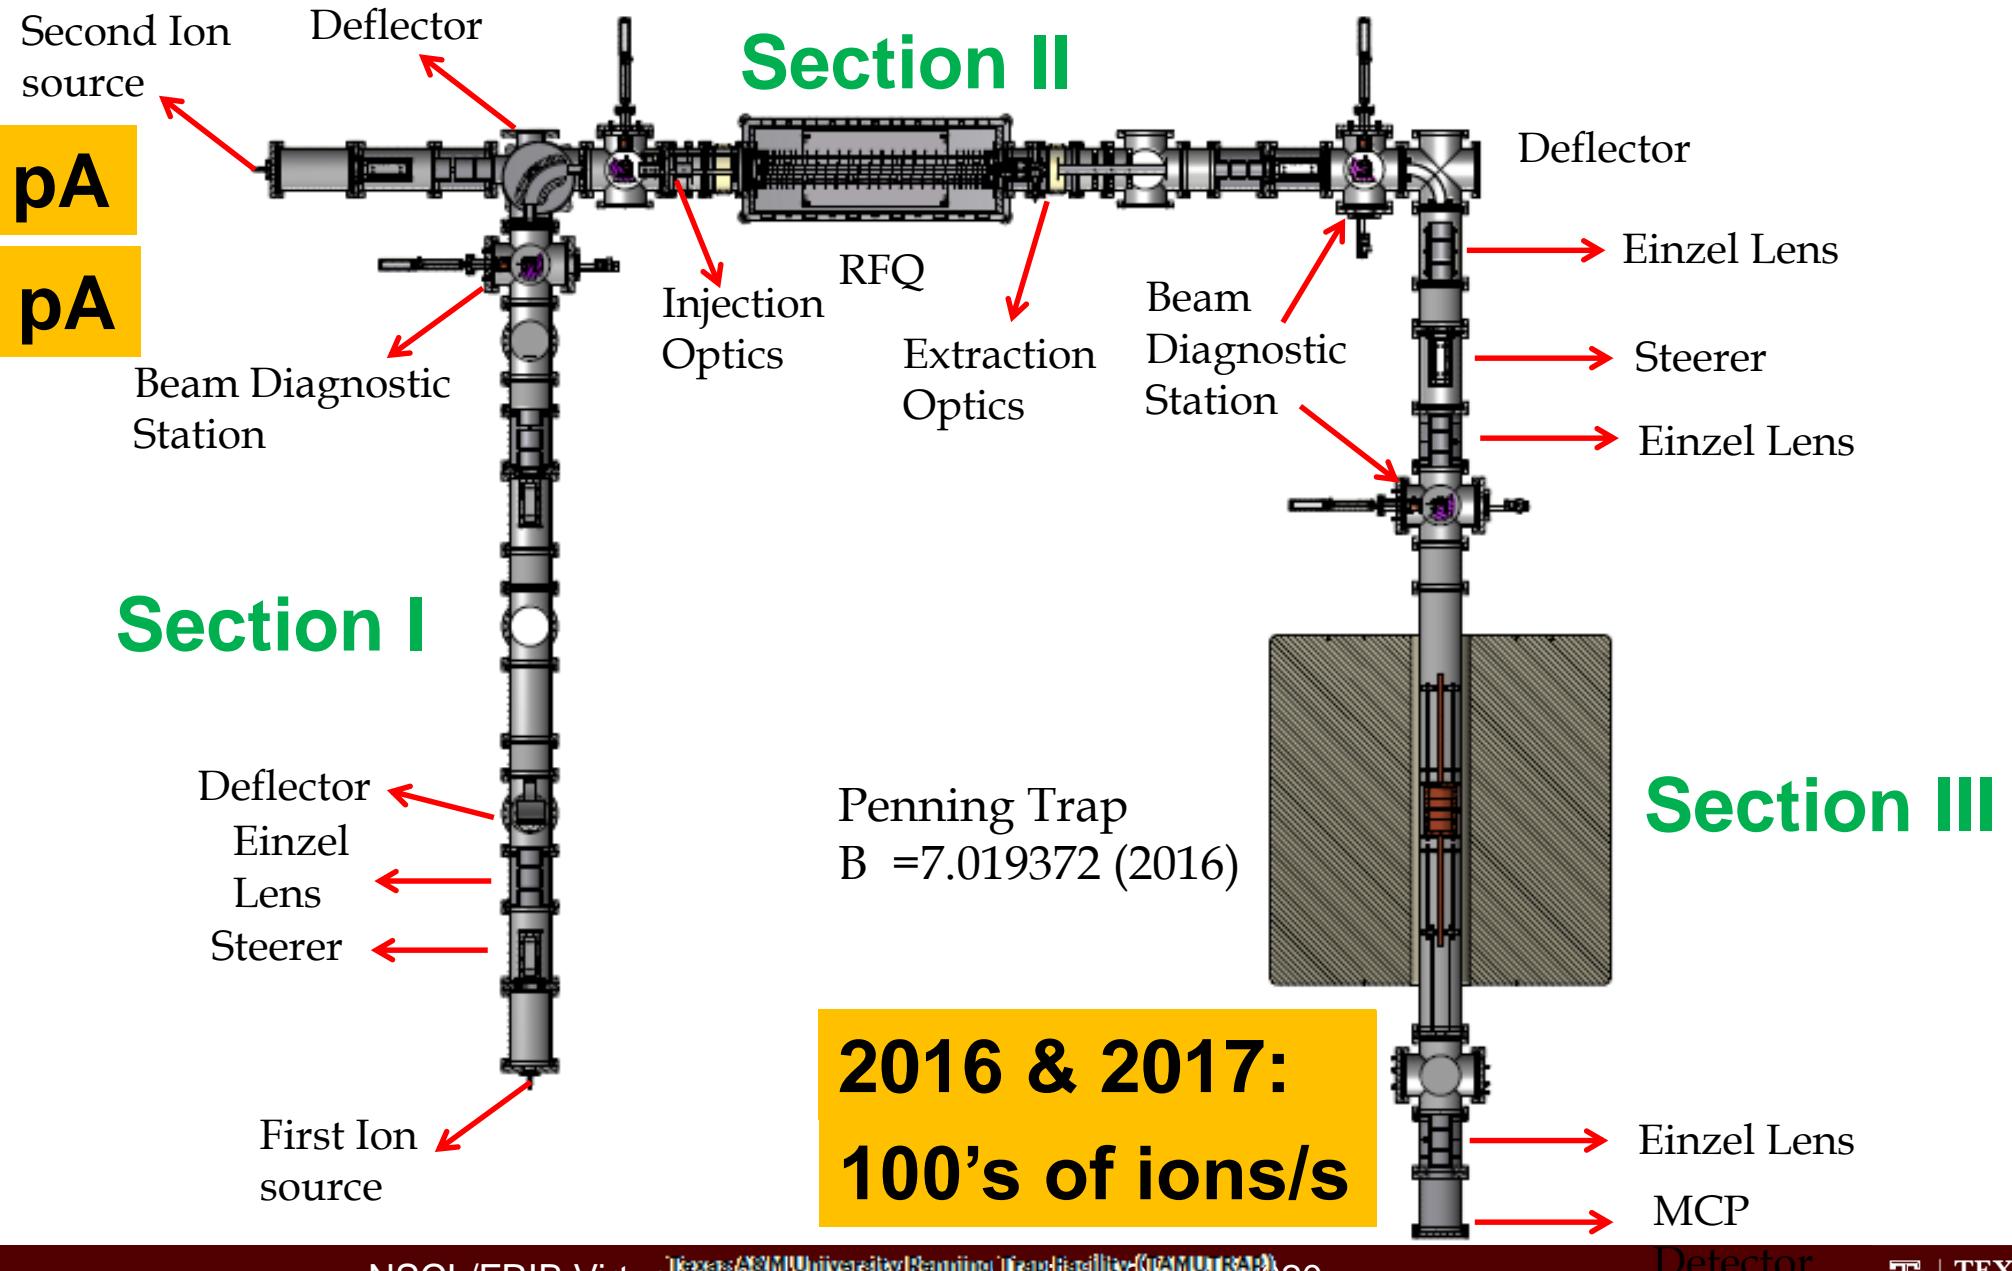

- Using COSY to optimize efficiency versus resolution

- \$0.75M proposal submitted to DOE

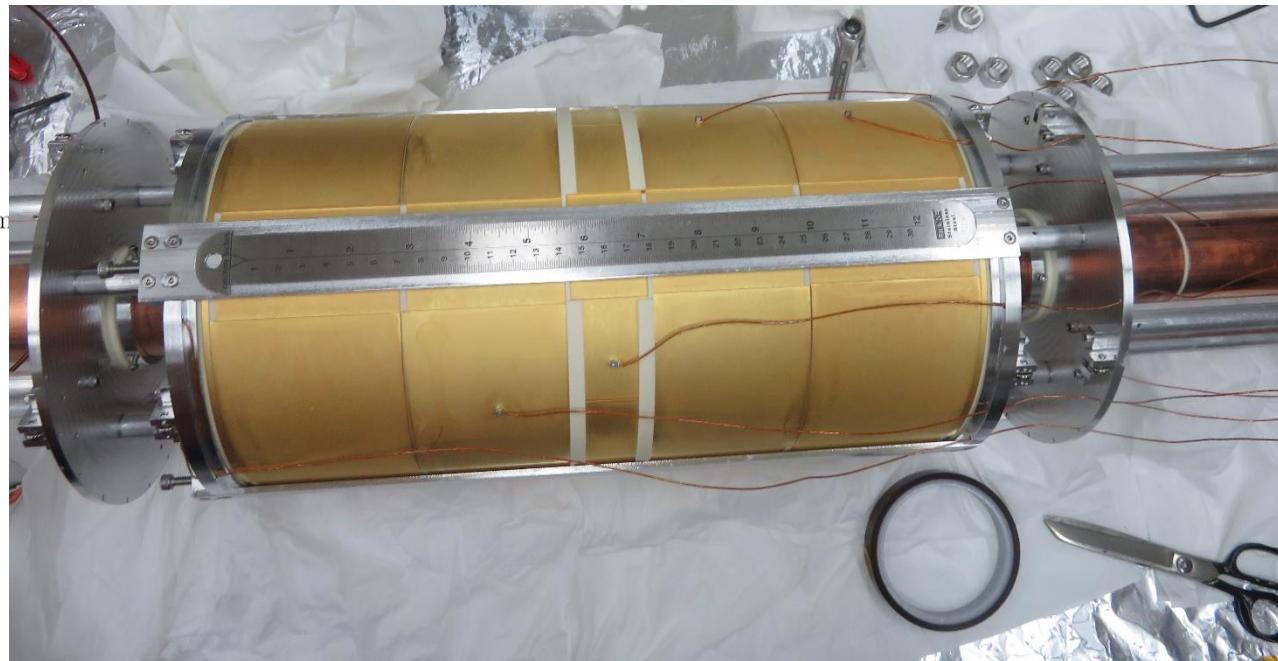

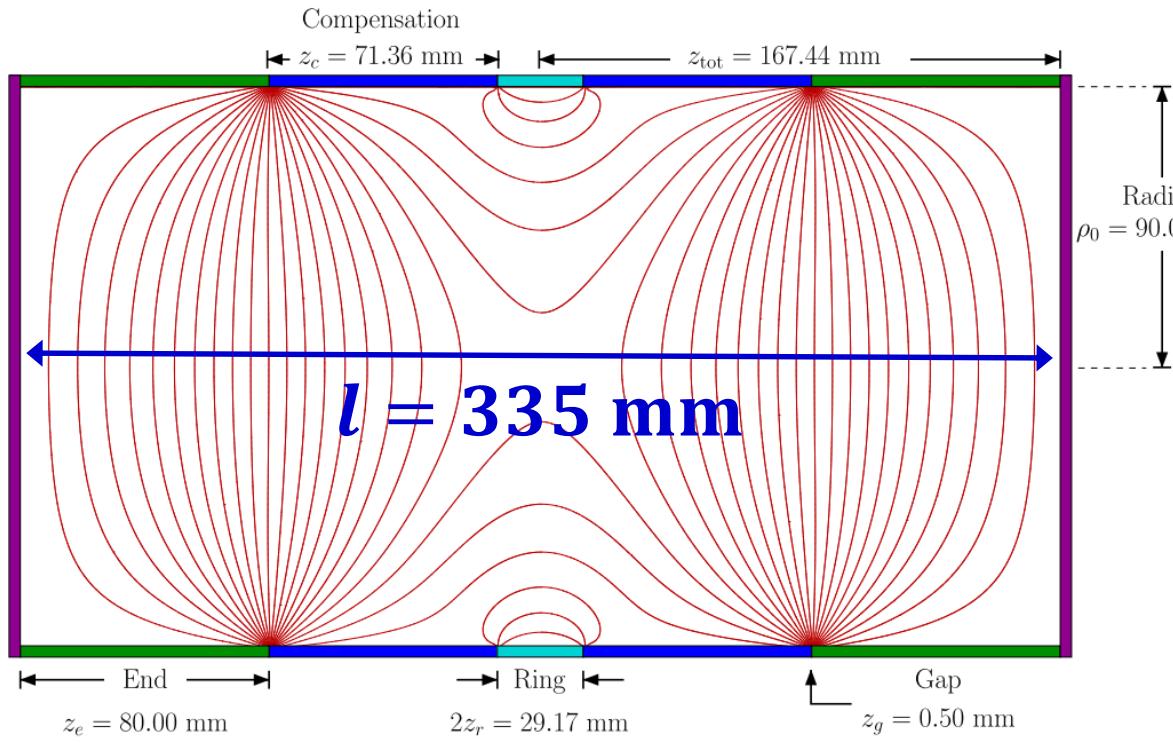

Start construction Spring 2021

The TAMUTRAP facility at the Cyclotron Institute

World's largest Penning trap commissioned

- Most cylindrical Penning traps have a length-to-radius ratio of $l/r = 11.75$
- To confine the protons from $T = 2$ decays, need $r = 90$ mm
- Needed a new design to make it fit in the 7T magnet

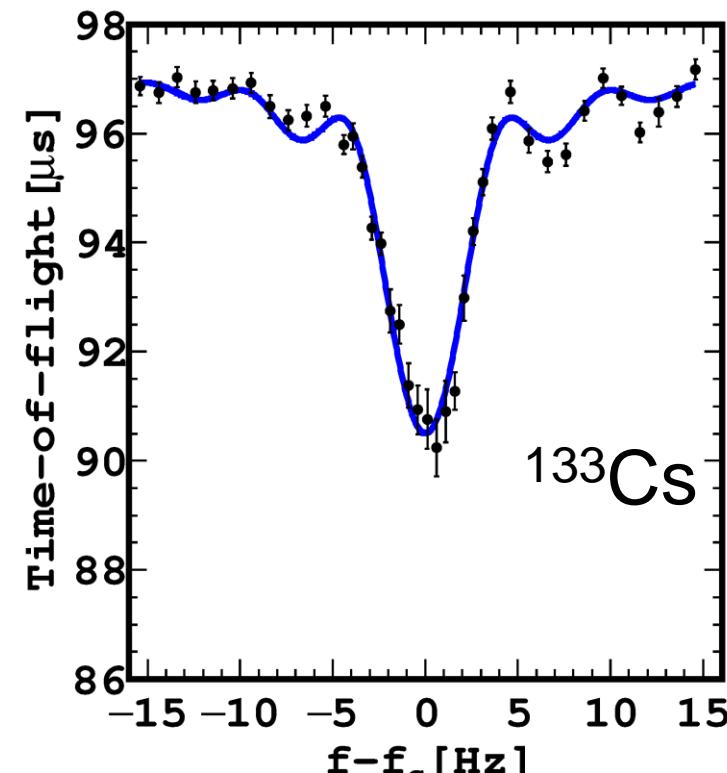

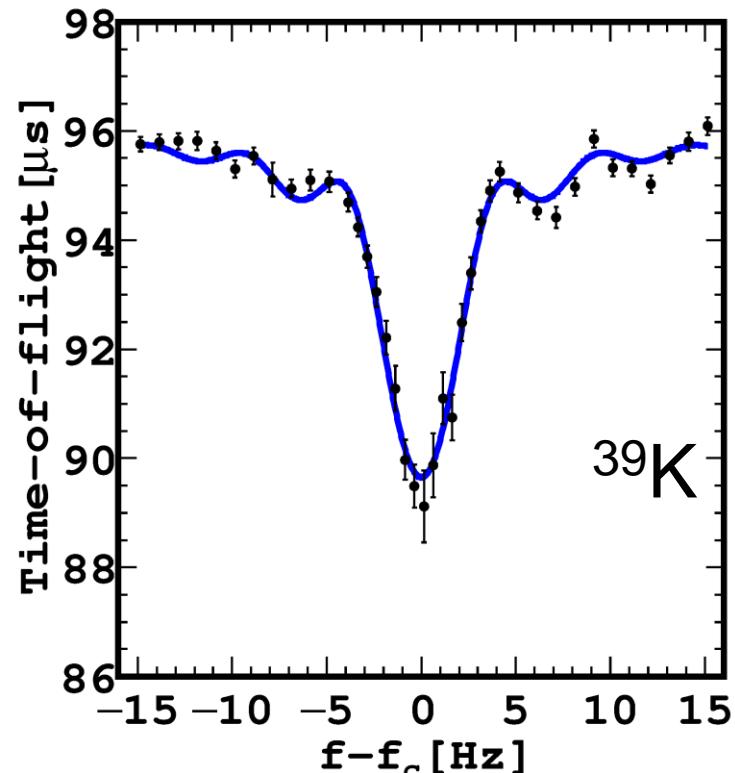

$$l/r = 3.72$$

M.Mehlman *et al.*, NIMA 712, 9 (2013)
P.Shidling *et al.*, Hyperfine Interact 240, 40 (2019)

Mass measurement of stable ions

- Find resonant frequencies for ^{23}Na , $^{85,87}\text{Rb}$, ^{133}Cs and ^{39}K
- Use AME value for ^{39}K , and calculate other masses
- Good agreement with AME values (within uncertainties)
- Precision
 - ^{23}Na : 240 ppb
 - ^{85}Rb : 5 ppb
 - ^{87}Rb : 6 ppb
 - ^{133}Cs : 7 ppb

200 ms excitation time

P.Shidling *et al.*, in preparation

Outline

● Introduction

- ★ Testing the standard model via the precision frontier
- ★ Angular correlations of β decay

● ^{37}K at TRIUMF

- ★ The TRINAT facility
- ★ Polarizing the cloud
- ★ Recent measurement of A_β

● TAMUTRAP

- ★ $T = 2$ decays to test the SM
- ★ Source production and commissioning mass measurements

● $^6\text{He } b_{\text{Fierz}}$ at UW

- ★ Cyclotron radiation emission spectroscopy
- ★ Plans to implement an ion trap to remove wall collisions

^6He at UW

- Most sensitive probe is the Fierz interference:

- Decay rate is: $d\omega = d\omega_0 \left[1 + a_{\beta\nu} \frac{\vec{p}_e \cdot \vec{p}_\nu}{E_e E_\nu} + b \frac{\Gamma m_e}{E_e} \right]$

- ^6He is a **great** case!

- Large endpoint (3.5 MeV)

$$a_{\beta\nu} \approx -\frac{1}{3} \left(1 - \frac{C_T^2 + C'^2_T}{2C_A^2} \right)$$

- Nuclear structure under control

$\beta - \nu$ correlation

- Simple decay

- Sensitive to tensor interactions

$$b \approx \pm \frac{(C_T + C'_T)}{C_A}$$

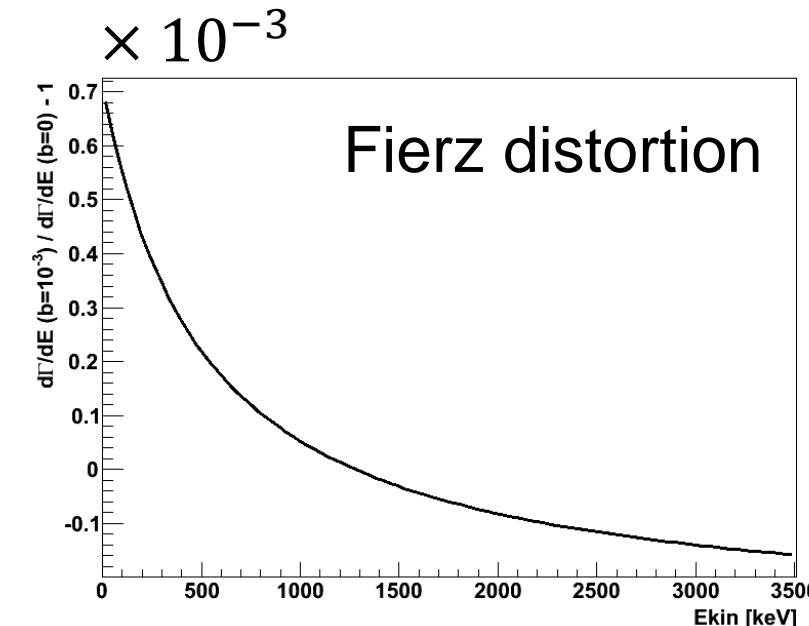

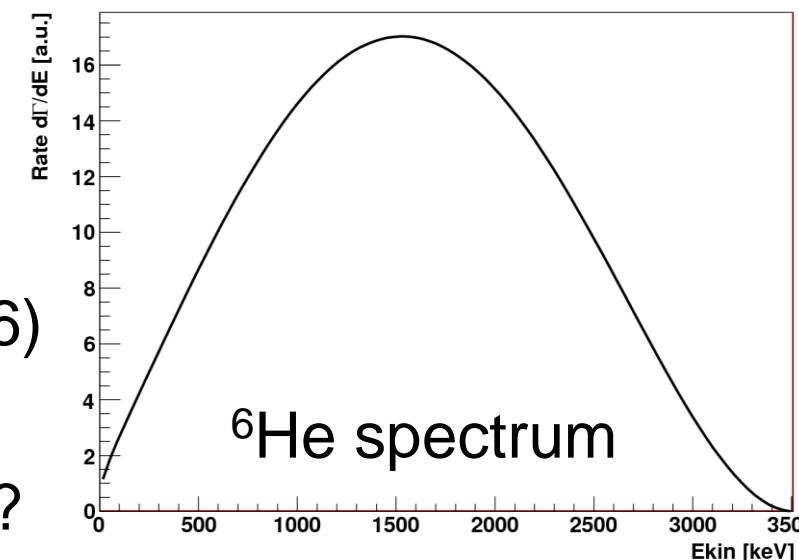

Fierz interference

- Status:

- Lifetime (PRC 86, 035506)

- Charge state fractions

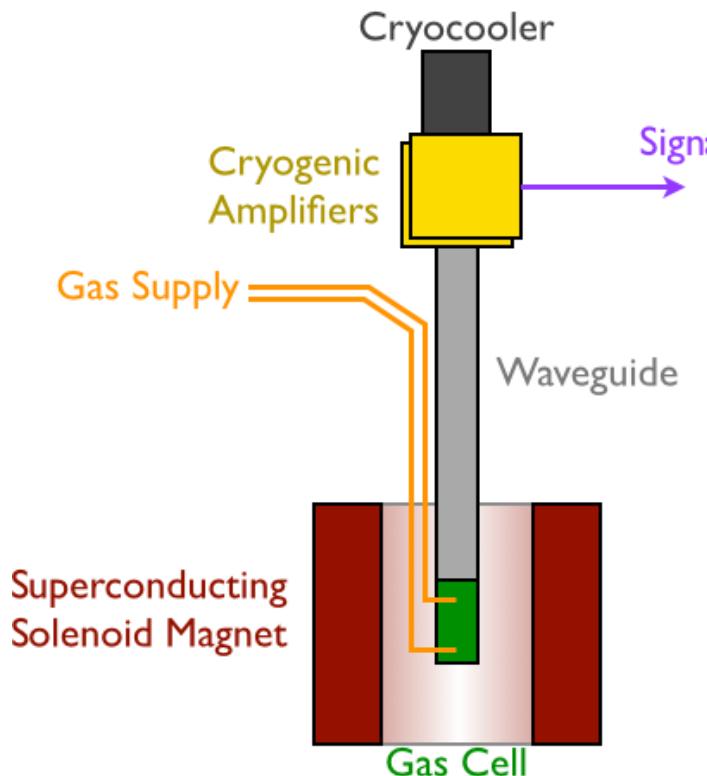

- $a_{\beta\nu}$: stats for 0.2%; systs?

^6He at UW – CRES technique

- New idea: use the Cyclotron Radiation Emission Spectroscopy (CRES) technique

★ Project 8 collaboration gets
 $\frac{FWHM}{E} \approx 10^{-3}$ resolution for
conversion electrons of 18 – 32 keV

(Project 8 Collaboration)

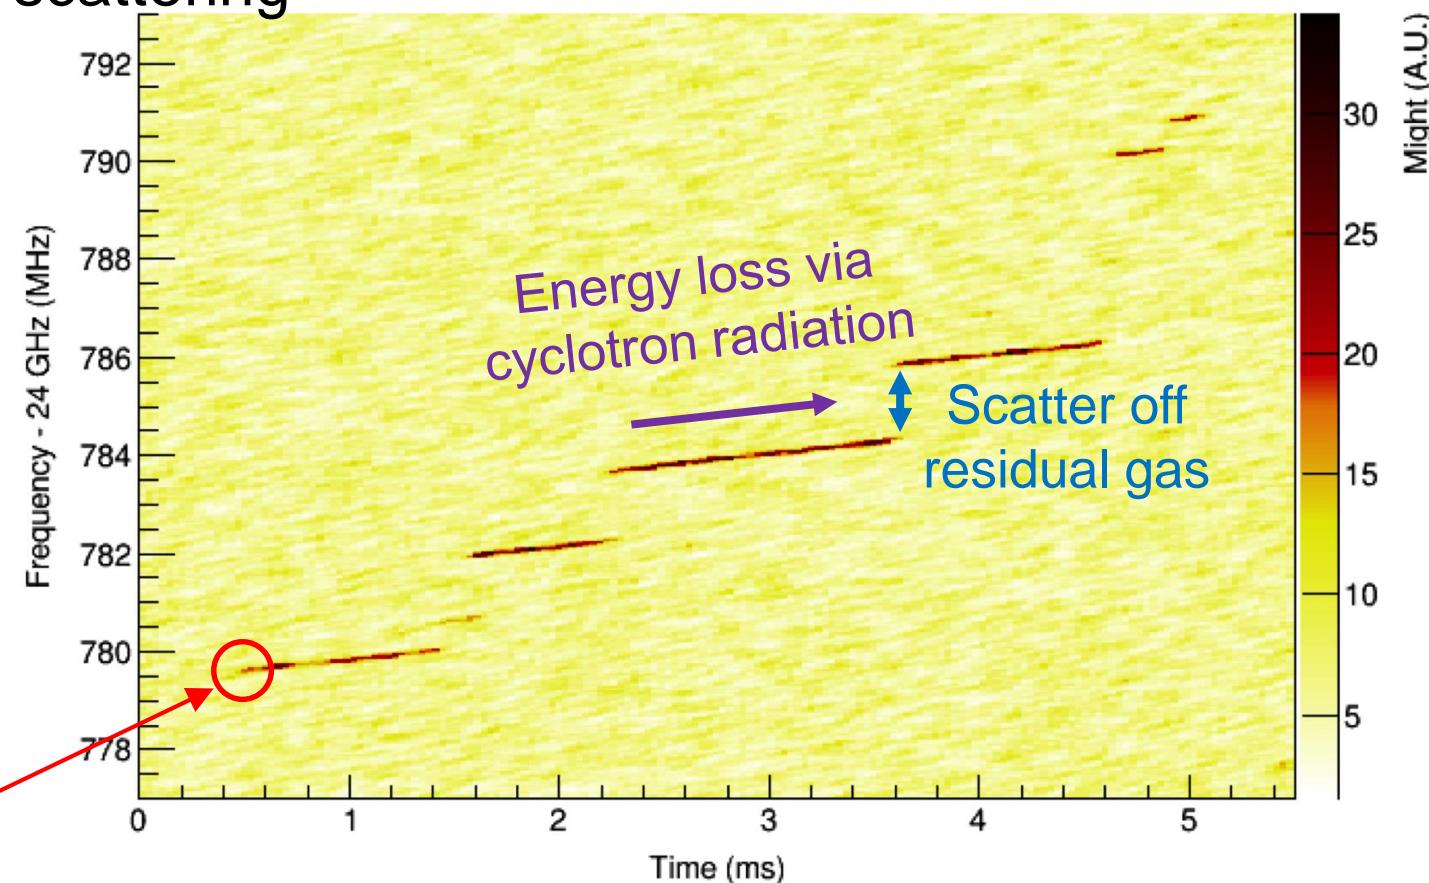

^6He at UW – CRES technique

• Why CRES for ^6He ?

- Measures β energy at creation, before complicated energy-loss mechanisms
- High resolution allows debugging of systematic uncertainties
- No background from photon or e scattering
- ^6He in gaseous form works well with the technique
- ^6He ion trap allows sensitivity higher than any other proposed
- Counts needed not a big demand on running time

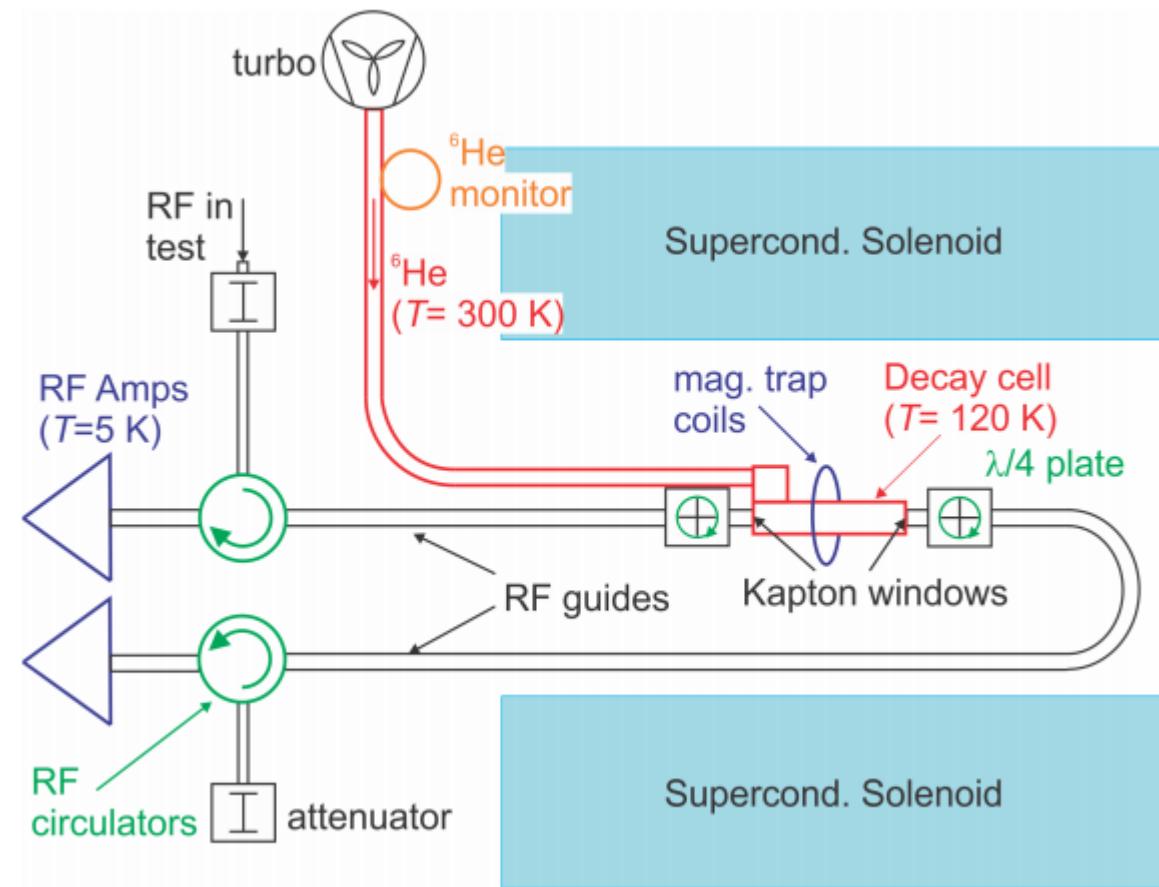

$$2\pi f = \frac{qB}{m + E_{\text{kin}}}$$

Initial frequency $\rightarrow E$

^6He little-*b* collaboration

- Phase I: proof of principle (next 3 yrs)
 - 2 GHz bandwidth
 - Show detection of cyclotron radiation from ^6He
 - Study power distribution

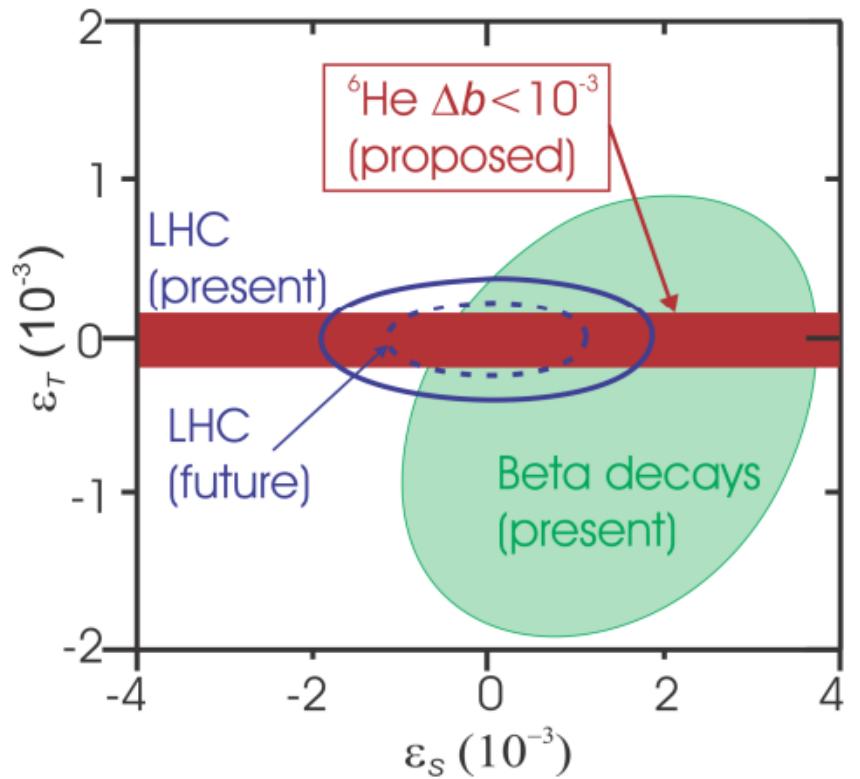

Emerging ${}^6\text{He}$ little- b collaboration

- Phase I: proof of principle (next 3 yrs)
 - 2 GHz bandwidth
 - Show detection of cyclotron radiation from ${}^6\text{He}$
 - Study power distribution

Effect	Δb
Magnetic field uncertainties	10^{-4}
Wall effect uncertainties	10^{-3}
RF pickup uncertainties	10^{-4}
Misidentification of events	10^{-4}
No trap	$< 10^{-4}$
Ion trap	10^{-5}

 - 6 GHz bandwidth
 - ${}^6\text{He}$ and ${}^{19}\text{Ne}$ measurements
- Phase III: ultimate measurement ($b < 10^{-4}$)
 - Ion trap for no limitation from geometric effect

Effect	No trap	Δb
Magnetic field uncertainties	10^{-4}	$< 10^{-4}$
Wall effect uncertainties	10^{-3}	
RF pickup uncertainties	10^{-4}	10^{-5}
Misidentification of events	10^{-4}	5×10^{-5}

TAMU's contribution is starting

- To bring ions into the trap, need a hole in the waveguide
- HFSS \Rightarrow signal degradation is <0.5 dB (no problem)

- Start designing RFQ cooler/buncher and Penning trap

Final thoughts, collaborators and thanks

- Ion and atom traps are helping pave the way for the precision frontier
- TRINAT: recent A_β result demonstrates ability; future is bright!
- TAMUTRAP: commissioned, just need radioactive ions...LSTAR starting
- ${}^6\text{He}$ b_{Fierz} with CRES: Phase 3 will crush the LHC!

TENURE-TRACK POSITION

PHYSICS & ASTRONOMY
TEXAS A&M UNIVERSITY®

EXPERIMENTAL NUCLEAR PHYSICS TEXAS A&M UNIVERSITY

The Physics and Astronomy Department at Texas A&M University seeks applications for a tenure-track assistant professor position in experimental nuclear physics under the auspices of the Nuclear Solutions Institute. This institute combines basic and applied nuclear science with nuclear security technology and policy; it already encompasses a broad spectrum of faculty members drawn from across the university. A selected candidate must hold an earned Ph.D. in physics or a related area. The appointment is expected to begin on or before September 1, 2021.

The successful candidate for this position will assume a tenure-track position in the Department of Physics and Astronomy with a joint appointment in the [Cyclotron Institute](#) and the [Nuclear Solutions Institute](#). More senior candidates may be considered at the associate professor or professor level. He/she is expected to assume full teaching responsibilities at the graduate and undergraduate levels and is also expected to conduct a vigorous research program based at the Cyclotron Institute and employing the facilities there, which include two cyclotrons – a newly refurbished K150 and a superconducting K500 – together with a wide variety of modern experimental equipment. An upgrade project, nearing completion, will utilize the two accelerators to make radioactive beams available to all target locations.
